Safety notices

This manual contains information which you should observe to ensure your own personal safety and prevent material damage. The notices referring to your personal safety are highlighted in the manual by a warning triangle; notices that relate to material damage only have no warning triangle. The notices shown below are graded according to the level of danger (from most to least dangerous):

Danger

Indicates that death or serious injury **will** result if proper precautions are not taken.

Warning

Indicates that death or serious injury **may** result if proper precautions are not taken.

Caution

With a warning triangle, indicates that minor injury **may** result if proper precautions are not taken.

Caution

Without a warning triangle, indicates that material damage may result if proper precautions are not taken.

Notice

Indicates that an undesirable result or state may occur if the relevant instructions are not observed.

If more than one level of danger exists, the warning for the highest level of danger is always used. A warning notice with a warning triangle indicating possible personal injury may also include a warning relating to material damage.

Qualified personnel

The associated device/system may only be installed and operated in conjunction with this documentation. The device/system may only be commissioned and operated by **qualified personnel**. For the purpose of the safety notices in this documentation, "qualified personnel" are those authorized to commission, ground, and label equipment, systems, and circuits in accordance with established safety procedures.

Proper use of Siemens products

Note the following:

Warning

Siemens products are only permitted to be used for the applications envisaged in the catalog and in the associated technical documentation. If third-party products and components are used, they must be recommended or approved by Siemens. To ensure proper and safe operation of these products, they must be correctly transported, stored, set up, mounted, installed, commissioned, operated, and maintained. The permissible ambient conditions must be met. Information in the associated documentation must be observed.

Preface

SINAMICS documentation

The SINAMICS documentation is organized in 2 parts:

- General documentation/catalogs
- Manufacturer/service documentation

At <http://www.siemens.com/motioncontrol/docu> information is available on the following topics:

- Ordering documentation

Here you can find an up-to-date overview of publications.

- Downloading documentation

Further links for downloading files from Service & Support

- Researching documentation online

Information on DOConCD and direct access to the publications in DOCon-Web.

- For customizing documentation based on Siemens content using My Documentation Manager (MDM), see

<http://www.siemens.com/mdm>

My Documentation Manager provides you with a range of features for creating your own machine documentation

- Training and FAQs

Information on the range of training courses and FAQs (Frequently Asked Questions) are available via the page navigation.

Usage phases and their tools/documents (as an example)

Target group

This documentation is aimed at machine manufacturers, commissioning engineers, and service personnel who use SINAMICS.

Use

This documentation contains the comprehensive information about parameters, function diagrams, and faults and alarms required to commission and service the system.

This manual should be used in addition to the other manuals and tools provided for the product.

Standard version

The scope of the functionality described in this document can differ from the scope of the functionality of the drive system that is actually supplied.

- It may be possible for other functions that are not described in this documentation to be executed in the drive system. This does not, however, represent an obligation to supply functions of this kind when new equipment is delivered or during servicing.
- The documentation may contain descriptions of functions that are not available in a particular product version of the drive system. The functionality of the supplied drive system should only be taken from the ordering documentation.
- Extensions or changes made by the machine manufacturer must be documented by the machine manufacturer.

For reasons of clarity, this documentation does not contain all of the detailed information on all of the product types. This documentation cannot take into consideration every conceivable type of installation, operation, and service/maintenance.

1.1.1 Explanation of list of parameters

Basic structure of parameter descriptions

The data in the following example has been chosen at random. The table below contains all the information that can be included in a parameter description. Some of the information is optional.

The parameter list (See Section 1.2) is structured as follows:

----- **Start of example** -----

pxxxx[0 to n] Parameter number

The parameter number consists of a "p" or "r", followed by the parameter number and the index (optional).

Examples of number representation in the parameter list:

- p... Adjustable parameter (read and write parameter)
- r... Display parameter (read-only)
- p0918 Adjustable parameter 918
- p0099[0 to 3] Adjustable parameter 99, indices 0 to 3
- p1001[0 to n] Adjustable parameter 1001, indices 0 to n (n = configurable)
- r0944 Display parameter 944

Other examples of notation in the documentation:

- p1070[1] Adjustable parameter 1070, index 1
- p2098[1].3 Adjustable parameter 2098, index 1 bit 3
- r0945[2](3) Display parameter 945, index 2 of drive object 3
- p0795.4 Adjustable parameter 795, bit 4
- r2129.0 to 15 Display parameter 2129 with bit array (maximum 16 bits)

The following applies to adjustable parameters:

The "shipped" parameter value is specified under "Factory setting" with the relevant unit in square parenthesis. The value can be adjusted within the range defined by "Min" and "Max".

The term "linked parameterization" is used in cases where changes to adjustable parameters affect the settings of other parameters.

Linked parameterization can occur, for example, as a result of the following actions or parameters:

- Execute macros
p0015, p0700, p1000, p1500
- Set PROFIBUS telegram (BICO interconnection)
p0922
- Set component lists
p0230, p0300, p0301, p0400
- Calculate and pre-assign automatically
p0112, p0340, p0578, p3900
- Restore factory settings
p0970

The following applies to display parameters:

The fields "Min", "Max" and "Factory setting" are specified with a dash "-" and the relevant unit in square parenthesis.

Note:

The parameter list can contain parameters that are not visible in the expert lists of the particular commissioning software (e.g. parameters for trace functions).

BICO: Full parameter name/Abbreviated name

The following abbreviations can appear in front of the parameter name:

- BI: Binector Input
This parameter is used for selecting the source of a digital signal.
- BO: Binector Output
This parameter is available as a digital signal for interconnection with other parameters.
- CI: Connector Input
This parameter is used for selecting the source of an "analog" signal.
- CO: Connector Output
This parameter is available as an "analog" signal for interconnection with other parameters.
- CO/BO: Connector/Binector Output
This parameter is available as an "analog" and digital signal for interconnection with other parameters.

Note:

A connector input (CI) cannot be just interconnected with any connector output (CO, signal source).

When interconnecting a connector input using the commissioning software, only the corresponding possible signal sources are listed.

Drive object (function module)

A drive object (DO) is an independent, "self-contained" functional unit that has its own parameters and, in some cases, faults and alarms.

When carrying out commissioning using the commissioning software, you can select/deselect additional functions and their parameters by activating/deactivating function modules accordingly.

The parameter list specifies the associated drive object and function module for each individual parameter.

Examples:

- p1070 Cl: Main setpoint
VECTOR
The parameter is only available with the VECTOR drive object, regardless of which function modules have been activated.
- p1055 Bl: Jog bit 0
VECTOR
The parameter is available with the VECTOR drive object, regardless of which function modules have been activated (i.e. it is available with every activated function module belonging to the drive object).

A parameter can belong to one, several, or all drive objects.

The following information relating to "Drive object" and "Function module" can be displayed under the parameter number:

Table 1-1 Data in "Drive object (function module)" field

Drive object (function module)	Type	Meaning
All objects	-	This parameter belongs to all drive objects.
CU	-	Control Unit, all versions
CU_G_G130	1	Control Unit SINAMICS G130
CU_G_G150	-	Control Unit SINAMICS G150
CU_G_G130 (CAN) CU_G_G150 (CAN)	-	Control Unit with "CAN" function module (p0108.29)
CU_G_G130 (COMM BOARD) CU_G_G150 (COMM BOARD)		Control Unit with "COMM BOARD" function module (p0108.30)
CU_G_G130 (PROFINET) CU_G_G150 (PROFINET)		Control Unit with "PROFINET" function module (p0108.31)
ENCODER	300	Object for a DRIVE-CLiQ encoder

TM31	200	Terminal Module 31

Table 1-1 Data in "Drive object (function module)" field, continued

Drive object (function module)	Type	Meaning
VECTOR_G130/G150	12	Vector drive
VECTOR_G130/G150 (n/M)	-	Vector drive with "Closed-loop speed/torque control" function module (r0108.2)
VECTOR_G130/G150 (Ext. brake)	-	Vector drive with "Extended brake control" function module (r0108.14).
VECTOR_G130/G150 (Parallel)	-	Vector drive with "Parallel connection" function module (r0108.15).
VECTOR_G130/G150 (Tech_ctrl)	-	Vector drive with "Technology controller" function module (r0108.16).
VECTOR_G130/G150 (Ext. msg)	-	Vector drive with "Extended messages/monitoring functions" function module (r0108.17).
VECTOR_G130/G150 (Cooling unit)	-	Vector drive with "Cooling unit" function module (r0108.28).
VECTOR_G130/G150 (CAN)	-	Vector drive with "CAN" function module (r0108.29)
VECTOR_G130/G150 (PROFINET)	-	Vector drive with "PROFINET" function module (r0108.31)

Note:

The drive object type is used to identify the drive objects in the drive system (e.g. r0107, r0975[1]).

Changeable in

The "-" sign indicates that the parameter can be changed in any object state and that the change will be effective immediately.

The letters "C1(x), C2(x), T, U" ((x): optional) mean that the parameter can be changed in the specified drive unit state only and that the change will not take effect until the object switches to another state. This can be one or more states.

The following states may be specified:

- C1(x) Device commissioning C1: **Commissioning 1**
 Device commissioning is in progress (p0009 > 0).
 Pulses cannot be enabled.
 The parameter can only be changed in the following device commissioning settings (p0009 > 0):
 - C1: Changeable for all settings p0009 > 0
 - C1(x): Only changeable when p0009 = x
 A modified parameter value does not take effect until device commissioning mode is exited with p0009 = 0.
- C2(x) Drive object commissioning C2: **Commissioning 2**
 Drive commissioning is in progress (p0009 = 0 and p0010 > 0).
 Pulses cannot be enabled.
 The parameter can only be changed in the following drive commissioning settings (p0010 > 0):
 - C2: Changeable for all settings p0010 > 0
 - C2(x): Only changeable when p0010 = x
 A modified parameter value does not take effect until drive commissioning mode is exited with p0010 = 0.
- U Operation U: **Run**
 Pulses are enabled.
- T Ready T: **Ready to run**
 The pulses are not enabled and status "C1(x)" or "C2(x)" is not active.

Note:

Parameter p0009 is CU-specific (belongs to Control Unit).

Parameter p0010 is drive-specific (belongs to each drive object).

The operating state of individual drive objects is displayed in r0002.

Calculated

Specifies whether the parameter is influenced by automatic calculations.

The calculation attribute defines which activities influence the parameter.

The following attributes apply:

- CALC_MOD_ALL
 - p0340 = 1
 - Project download with commissioning software and send from p0340 = 3
- CALC_MOD_CON
 - p0340 = 1, 3, 4
- CALC_MOD_EQU
 - p0340 = 1, 2
- CALC_MOD_LIM_REF
 - p0340 = 1, 3, 5
 - p0578 = 1
- CALC_MOD_REG
 - p0340 = 1, 3

Note:

For p3900 > 0, p0340 = 1 is also called automatically.

After p1910 = 1, p0340 = 3 is automatically called.

Access level

Specifies the access level required to be able to display and change the relevant parameter. The required access level can be set via p0003.

The system uses the following access levels:

1. Standard
2. Advanced
3. Expert
4. Service
 - Parameters with this access level have password protection.
5. Macro (the parameter can only be changed via macro)

Note:

Parameter p0003 is CU-specific (belongs to Control Unit).

Data type

The information on the data type can consist of the following two items (separated by a slash):

- First item
Data type of the parameter
- Second item (for binector or connector input only)
Data type of the signal source to be interconnected (binector/connector output)

Parameters can have the following data types:

- I8 Integer8 8-bit integer
- I16 Integer16 16-bit integer
- I32 Integer32 32-bit integer
- U8 Unsigned8 8 bits without sign
- U16 Unsigned16 16 bits without sign
- U32 Unsigned32 32 bits without sign
- Float FloatingPoint32 32-bit Floating Point number

Depending on the data type of the BICO input parameter (signal sink) and BICO output parameter (signal source), the following combinations are possible when BICO interconnections are established:

Table 1-2 Possible combinations of BICO interconnections

	BICO input parameter			
	CI parameter			BI parameter
BICO output parameter	Unsigned32/Integer16	Unsigned32/Integer32	Unsigned32/FloatingPoint32	Unsigned32/Binary

Dynamic index

For parameters with a dynamic index [0 to n], the following information is specified here:

- Data set (if this is available).
- Parameter for the number of indices ($n = \text{number} - 1$).

The following information can be contained in this field:

- "CDS, p0170" (command data set, CDS count)

Example:

p1070[0] → main setpoint [command data set 0]

p1070[1] → main setpoint [command data set 1], etc.

- "DDS, p0180" (drive data set, DDS count)
- "EDS, p0140" (encoder data set, EDS count)
- "MDS, p0130" (motor data set, MDS count)
- "PDS, p0120" (power unit data set, PDS count)
- "p2615" (traversing blocks count)

Function diagram

The parameter is included in this function diagram. The structure of the parameter function and its relationship with other parameters is shown in the specified function diagram.

Example:

Function diagram: 3060.3 3060: Function diagram number
3: Signal path (optional)

P group (refers only to access via BOP (Basic Operator Panel))

Specifies the functional group to which the parameter belongs. The required parameter group can be set via p0004.

Note:

Parameter p0004 is CU-specific (belongs to Control Unit).

"Unit", "Unit group", and "Unit selection"

The standard unit of a parameter is specified in square brackets after the values for "Min", "Max", and "Factory setting".

For parameters where the unit can be switched, the specifications for "Unit group" and "Unit selection" determine the group to which this parameter belongs and with which parameter the unit can be changed over.

Example:

Unit group: 7_1, unit selection: p0505

The parameter belongs to unit group 7_1 and the unit can be changed over using p0505.

All the potential unit groups and possible unit selections are listed below.

Table 1-3 Unit groups (p0100)

Table 1-6 Unit group (p0595)

Unit group	Unit selection for p0595 =		Reference quantity for %
	Value	Unit	
9_1	The values that can be set and the technological units are shown in p0595 (See Section 1.2).		

Parameter values

Min	Minimum value of the parameter [unit]
Max	Maximum value of the parameter [unit]
Factory setting	Shipped value (default) [unit]
	A different value may be displayed for certain parameters (e.g. p1800) during first commissioning. Reason: The setting of these parameters is determined by the operating environment of the Control Unit (e.g. depending on device type, macro, power unit).

Note:

For SINAMICS G130/G150, the macros and their settings are provided in the following documentation:

SINAMICS G130/G150 Operating Instructions

Not for motor type

Specifies for which motor type this parameter has no significance

ASM: Induction motor

FEM: Separately excited synchronous motor

PEM: Permanent-magnet synchronous motor

REL: Reluctance motor/SIEMOSYN motor

Normalizing

Specifies the reference quantity that is used to convert a signal value automatically with a BICO interconnection.

The following reference quantities may be specified:

- p2000 to p2007: Reference speed, reference voltage, etc.
- TEMP: 100 = 100%
- PERCENT: 1.0 = 100%
- 4000H: 4000 hex = 100%

Expert list

Specifies whether this parameter is available in the expert list of the specified drive objects in the commissioning software

1: Parameter does exist in the expert list.

0: Parameter does not exist in the expert list.

Notice:

The user shall assume full responsibility for using parameters marked "Expert list: 0" (parameter does not exist in the expert list).

These parameters and their functionalities have not been tested and no further user documentation is available for them (e.g. description of functions). Moreover, no support is provided for these parameters by "Technical Support" (hotline).

Description

Explanation of the function of a parameter

Values

Recommendation

Information about recommended settings

Index

The name and meaning of each individual index is specified for indexed parameters.

The following applies to the values (Min, Max, Factory setting) of indexed adjustable parameters:

- Min, Max:

The adjustment range and unit apply to all indices.

- Factory setting:

When all indices have the same factory setting, index 0 is specified with the unit to represent all indices.

When the indices have different factory settings, they are all listed individually with the unit.

Bit array

For parameters with bit arrays, the following information is provided about each bit:

- Bit number and signal name
- Meaning with signal states 0 and 1
- Function diagram (optional)

The signal is shown on this function diagram.

Dependency

Conditions that must be fulfilled for this parameter. Also includes special effects that can occur between this parameter and others.

1.1.2 Number ranges of parameters

Note:

The following number ranges represent an overview for all parameters in SINAMICS.

The parameters for the product described in this List Manual are described in detail in Section 1.2.

Parameters are grouped into the following number ranges:

Table 1-7 Number ranges of parameters

Range		Description
From	To	
0000	0099	Operation and visualization
0100	0199	Commissioning
0200	0299	Power unit
0300	0399	Motor
0400	0499	Encoder
0500	0599	Technology and units
0600	0699	Thermal motor monitoring and motor model, maximum current
0700	0799	Command sources and terminals on Control Unit, measuring sockets
0800	0839	CDS, DDS data sets (e.g. switch over, copy)
0840	0879	Sequence control (e.g. source for ON/OFF1)

Dependency:	Refer to: r0046		
Notice:	For several missing enable signals, the corresponding value with the highest number is displayed.		

Note:

OC: Operating condition
 EP: Enable Pulses (pulse enable)
 RFG: Ramp-function generator
 COMM: Commissioning
 MotID: Motor data identification
 SS2: Safe Stop 2
 SOS: Safe Operating Stop
 STO: Safe Torque Off

p0003 BOP access level / BOP acc_level

CU_G_G130, CU_G_G150	Can be changed: C1, U, T	Calculated: -	Access level: 1
	Data type: Integer16	Dynamic index: -	Func. diagram: -
	P-Group: -	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0	Max 4	Factory setting 1

Description: Sets the access level for reading and writing parameters via the Basic Operator Panel (BOP).

Value:

0: User-defined
 1: Standard
 2: Extended
 3: Expert
 4: Service

Note:

Access level 0 (user-defined):
 Parameters from the user-defined list (p0013). Not used as of firmware version 2.6 (p0016).
 Access level 1 (standard):
 Parameters for the simplest operator control possibility (e.g. p1120 = ramp-function generator, ramp-up time).
 Access level 2 (extended):
 Parameters to operate the basic functions of the drive unit.
 Access level 3 (experts):
 Expert know-how is required for these parameters (e.g. BICO parameterization).
 Access level 4 (service):
 For these parameters, it is necessary that authorized service personnel enter the appropriate password (p3950).

p0004 BOP display filter / BOP disp_filter

CU_G_G130, CU_G_G150	Can be changed: C2(1), U, T	Calculated: -	Access level: 1
	Data type: Integer16	Dynamic index: -	Func. diagram: -
	P-Group: -	Units group: -	Unit selection: -
	Not for motor type: ASM	Scaling: -	Expert list: 1
	Min 0	Max 99	Factory setting 0

Description: Sets the display filter for parameters with the Basic Operator Panel (BOP).

Value:	0:	All parameters
	1:	Displays, signals
	2:	Power unit
	3:	Motor
	4:	Encoder/pos enc
	5:	Technology/units
	7:	Digital inputs/outputs commands sequence control
	8:	Analog inputs/outputs
	10:	Setpoint channel/ramp-fct generator
	12:	Functions
	13:	V/f control
	14:	Control
	15:	Data sets
	17:	Basic positioner
	18:	Gating unit
	19:	Motor identification
	20:	Communication
	21:	Faults, alarms, monitoring functions
	25:	Closed loop position control
	28:	Free function blocks
	47:	Trace and function generator
	50:	OA parameters
	90:	Topology
	95:	Safety Integrated
	98:	Command Data Sets (CDS)
	99:	Drive Data Sets (DDS)

Dependency: Refer to: p0003

Notice: The display filter via p0004 provides precise filtering and displays the corresponding parameters only when p0009 and p0010 = 0.

Note: The set access level via p0003 is also relevant for the display filter via p0004.
Examples (assumption: p0009 = p0010 = 0):
p0003 = 1, p0004 = 3
--> Only the parameters for the motor are displayed with access level 1.
p0003 = 2, p0004 = 3
--> Only the parameters for the motor are displayed with access levels 1 and 2.

p0005[0...1] BOP operating display selection / BOP op_disp sel

All objects	Can be changed: U, T	Calculated: -	Access level: 2
	Data type: Unsigned16	Dynamic index: -	Func. diagram: -
	P-Group: -	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	65535	[0] 2 [1] 0

Description: Sets the parameter number and parameter index for display for p0006 = 2, 4 for the Basic Operator Panel (BOP).
Examples for the SERVO drive object:

p0005[0] = 21, p0005[1] = 0: Actual speed smoothed (r0021)
p0005[0] = 25, p0005[1] = 0: Output voltage smoothed (r0025)
p0005[0] = 27, p0005[1] = 0: Absolute current actual value, smoothed (r0027)

Index: [0] = Parameter number
[1] = Parameter index

Dependency: Refer to: p0006

Note: Procedure:

1.
The parameter number to be displayed should be set in index 0. Only the monitoring parameters (read-only parameters) can be set that actually exist for the actual drive object.
If the set parameter number is not indexed, or if there is an index in index 1 that lies outside the valid range of the set parameter, then index 1 is automatically set to 0.
2.
The index that belongs to the parameter set in index 0 should be set in index 1. The permissible changes in index 1 always depend on the parameter number set in index 0.

p0006		BOP operating display mode / BOP op_disp mode	
CU_G_G130, CU_G_G150, ENCODER, HUB, TB30, TM31, TM54F_MA, TM54F_SL	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Integer16	Dynamic index: -	Func. diagram: -
	P-Group: -	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 4	Max 4	Factory setting 4
Description:	Sets the mode of the operating display for the Basic Operator Panel (BOP) in the operating states "ready for operation" and "operation".		
Value:	4: p0005		
Dependency:	Refer to: p0005		
Note:	Mode 0 ... 3 can only be selected if also r0020, r0021 are available on the drive object. Mode 4 is available for all drive objects.		

p0006		BOP operating display mode / BOP op_disp mode	
VECTOR_G130/G150	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Integer16	Dynamic index: -	Func. diagram: -
	P-Group: -	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0	Max 4	Factory setting 4
Description:	Sets the mode of the operating display for the Basic Operator Panel (BOP) in the operating states "ready for operation" and "operation".		
Value:	0: Operation --> r0021, otherwise r0020 <--> r0021 1: Operation --> r0021, otherwise r0020 2: Operation --> p0005, otherwise p0005 <--> r0020 3: Operation --> r0002, otherwise r0002 <--> r0020 4: p0005		
Dependency:	Refer to: p0005		
Note:	Mode 0 ... 3 can only be selected if also r0020, r0021 are available on the drive object. Mode 4 is available for all drive objects.		

p0007		BOP background lighting / BOP lighting	
CU_G_G130, CU_G_G150	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: Unsigned32	Dynamic index: -	Func. diagram: -
	P-Group: -	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0 [s]	Max 2000 [s]	Factory setting 0 [s]
Description:	Sets the delay time until the background lighting of the Basic Operator Panel (BOP) is switched off. If no keys are actuated, then the background lighting automatically switches itself off after this time has expired.		
Note:	p0007 = 0: Background lighting is always switched on (factory setting).		

p0008	BOP drive object after booting / BOP DO after boot		
CU_G_G130, CU_G_G150	Can be changed: U, T Data type: Unsigned16 P-Group: - Not for motor type: - Min 1 Max 65535	Calculated: - Dynamic index: - Units group: - Scaling: -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the required drive object that is active at the Basic Operator Panel (BOP) after booting.		
Note:	The value from p0008 initializes the display on the Basic Operator Panel (BOP) at the top left after booting. The drive object Control Unit is selected using the value 1.		
p0009	Device commissioning parameter filter / Dev comm par_filt		
CU_G_G130, CU_G_G150	Can be changed: C1, T Data type: Integer16 P-Group: - Not for motor type: - Min 0 Max 10000	Calculated: - Dynamic index: - Units group: - Scaling: -	Access level: 1 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 1
Description:	Sets the device and basic drive commissioning. By appropriately setting this parameter, those parameters are filtered that can be written into in the various commissioning steps.		
Value:	0: Ready 1: Device configuration 2: Defining the drive type/function module 3: Drive base configuration 4: Data set base configuration 29: Device download 30: Parameter reset 50: OA application configuration 55: OA application installation 101: Topology input 111: Insert drive object 112: Delete drive object 113: Change drive object number 114: Change component number 115: Parameter download 117: Delete component 10000: Ready (asynchronous)		
Notice:	For p0009 = 10000 the following applies: After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.		
Note:	The drives can only be powered up outside the device commissioning (the inverter enabled). In this case, p0009 must be 0 (Ready) and the individual drive objects must have already gone into operation (p0010). p0009 = 1: Device configuration At the first commissioning of the device, after booting, the device is in the "device configuration" state. To start the internal automatic first commissioning of the drive unit, p0009 should be set to 0 (Ready) after the ID for the actual topology (r0098) was transferred into the ID for the target topology (p0099). To do this, it is sufficient to set a single index value of p0099[x] the same as r0098[x]. Before the device has been completely commissioned, no other parameter can be changed. After the first commissioning was carried out, in this state, when required, other basic device configuration parameters can be adapted (e.g. the basic sampling time in p0110). p0009 = 2: Defines the drive type / function module In this state, the drive object types and/or the function modules can be changed or selected for the individual drive objects. To do this, the drive object type can be set using p0107[0...15] and the function can be set using p0108[0...15] (refer to p0101[0...15]).		

p0009 = 3: Drive basis configuration

In this state, after the device has been commissioned for the first time, basic changes can be made for the individual drive objects (e.g. sampling times in p0111, p0112, p0115 and the number of data sets in p0120, p0130, p0140, p0170, p0180).

p0009 = 4: Data set basis configuration

In this state, after the device has been commissioned for the first time, for the individual drive objects changes can be made regarding the assignment of the components (p0121, p0131, p0141, p0151, p0161) to the individual data sets and the assignment of the power unit, motor and encoder to the drive data sets (p0185, ...).

p0009 = 29: Device download

If a download is made using the commissioning software, the device is automatically brought into this state. After the download has been completed, p0009 is automatically set to 0 (ready). It is not possible to manually set p0009 to this value.

p0009 = 30: Parameter reset

In order to bring the complete unit into the "first commissioning" state or to load the parameters saved using p0977, to start, p0009 must be set to this value. p0976 can then be changed to the required value.

p0009 = 50: OA application configuration

In this state, after the device has been commissioned for the first time, changes can be made for the individual drive objects regarding the activity (p4956) of the OA applications.

p0009 = 55: OA application installation

OA applications can be installed and/or uninstalled in this state.

p0009 = 101: Topology input

In this state, the DRIVE-CLiQ target topology can be entered using p9902 and p9903.

p0009 = 111: Insert drive object

This state allows a new drive object to be inserted using p9911.

p0009 = 112: Delete drive object

This state allows existing drive objects to be deleted using p9912 after the device has been commissioned for the first time.

p0009 = 113: Change drive object number

This state allows the drive object number of existing drive objects to be changed using p9913 after the device has been commissioned for the first time.

p0009 = 114: Change component number

This state allows the component number of existing components to be changed using p9914 after the device has been commissioned for the first time.

p0009 = 115: Parameter download

This state allows the complete device and drive commissioning using the parameter services.

p0009 = 117: Delete component

This state allows components to be deleted using p9917 after the device has been commissioned for the first time.

The motor utilization is formed from the ratio between the I2t motor model temperature (minus 40 Kelvin) and the reference value p0605 (motor overtemperature, fault threshold) - 40 Kelvin. If p0605 is reduced, r0034 increases and the motor temperature remains the same. Refer to: p0611, p0612, p0615		
Note:	Smoothing time constant = 100 ms The signal is not suitable as a process quantity and may only be used as a display quantity. A value of r0034 = -200.0 % indicates an invalid display, for example, because the thermal I2t motor model was not activated or was incorrectly parameterized.

Description:	Displays the actual temperature in the motor.		
Note:	For r0035 not equal to -200.0 °C, the following applies: - this temperature display is valid. - a KTY sensor is connected. - the thermal model for the induction motor is activated (p0612 bit 1 = 1 and temperature sensor deactivated: p0600 = 0 or p0601 = 0). For r0035 equal to -200.0 °C, the following applies: - this temperature display is not valid (temperature sensor error). - A PTC sensor or bimetallic NC contact is connected. - the temperature sensor of the synchronous motor is deactivated (p0600 = 0 or p0601 = 0).

Description:	Displays the power unit overload determined using the I2t calculation. A current reference value is defined for the I2t monitoring of the power unit. It represents the current that can be conducted by the power unit without any influence of the switching losses (e.g. the continuously permissible current of the capacitors, inductances, busbars, etc.). If the I2t reference current of the power unit is not exceeded, then an overload (0 %) is not displayed. In the other case, the degree of thermal overload is calculated, whereby 100% results in a trip.

- the pulse enable via terminal EP is missing (booksize: X21, chassis: X41).

Bit 09 = 1 (enable signal missing), if:

- the signal source in p0864 is a 0 signal.

Bit 10 = 1 (enable signal missing), if:

- the signal source in p1140 is a 0 signal.

Bit 11 = 1 (enable signal missing) if the speed setpoint is frozen, because:

- the signal source in p1141 is a 0 signal.
- the speed setpoint is entered from jogging and the two signal sources for jogging, bit 0 (p1055) and bit 1 (p1056) have a 1 signal.

Bit 12 = 1 (enable signal missing), if:

- the signal source in p1142 is a 0 signal.
- When activating the function module "basic positioner" (r0108.4 = 1), the signal source in p1142 is set to a 0 signal.

Bit 16 = 1 (enable signal missing), if:

- there is an OFF1 fault response. The system is only enabled if the fault is removed and was acknowledged and the "switching on inhibited" withdrawn with OFF1 = 0.

Bit 17 = 1 (enable signal missing), if:

- commissioning mode is selected (p0009 > 0 or p0010 > 0).
- there is an OFF2 fault response.
- the drive is inactive (p0105 = 0) or is not operational (r7850[DO-Index]=0).

Bit 18 = 1 (enable signal missing), if:

- OFF3 has still not been completed or an OFF3 fault response is present.

Bit 19 = 1 (internal pulse enable missing), if:

- synchronization is running between the basic clock cycle, DRIVE-CLiQ clock cycle and application clock cycle.

Bit 20 = 1 (internal armature short-circuit active), if:

- the drive is not in the state "S4: Operation" or "S5x" (refer to function diagram 2610).
- the internal pulse enable is missing (r0046.19 = 0).

Bit 21 = 1 (enable signal missing), if:

The pulses have been enabled and the speed setpoint has still not been enabled, because:

- the holding brake opening time (p1216) has still not expired.
- the motor has still not been magnetized (induction motor).
- the encoder has not been calibrated (V/f vector and synchronous motor)

Bit 22: Being prepared

Bit 26 = 1 (enable signal missing), if:

- the drive is inactive (p0105 = 0) or is not operational (r7850[DO-Index]=0).

Bit 27 = 1 (enable signal missing), if:

- demagnetizing has still not been completed (only for vector).

Bit 28 = 1 (enable signal missing), if:

- the holding brake is closed or has still not been opened.

Bit 29 = 1 (enable signal missing), if:

- the cooling system ready signal via BI: p0266[1] missing.

Bit 30 = 1 (speed controller inhibited), if one of the following reasons is present:

- A 0 signal is available via BI: p0856.
- the function generator with current input is active.
- the measuring function "current controller reference frequency characteristic" is active.
- the pole position identification is active.
- motor data identification is active (only certain steps).

Bit 31 = 1 (enable signal missing), if:

- the speed setpoint from jog 1 or 2 is entered.

	P-Group: -	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	1	0

Description: Setting to pre-assign/check the sampling times for the internal controller clock cycles for clock-synchronous PROFIBUS operation.

p0092 = 1:

The controller clock cycles are set so that clock synchronous PROFIBUS operation is possible. If it is not possible to change the controller clock cycles of the clock-cycle synchronous PROFIBUS operation, then an appropriate message is output.

The presetting of the controller clock cycles can result in a derating of the Motor Module (e.g. p0115[0] = 400 µs --> 375 µs).

When the drive unit utilization (r9976) is calculated, its maximum computing time load has already been calculated during ramp-up for clock-cycle synchronous operation and taken into account in r9976 (V4.3 and higher), if fixed DCC runtime groups "Receive AFTER IF1 PROFIdrive PZD" and "Send BEFORE IF1 PROFIdrive PZD" are used.

p0092 = 0:

The controller clock cycles are set without any restrictions by the clock-cycle PROFIBUS operation (as for up to version V2.3).

When the drive unit utilization (r9976) is calculated, its maximum computing time load has already been calculated during ramp-up for non-clock-cycle-synchronous operation and taken into account in r9976 (V4.3 and higher), if fixed DCC runtime groups "Receive AFTER IF1 PROFIdrive PZD" and "Send BEFORE IF1 PROFIdrive PZD" are used.

Value:
0: No isochronous PROFIBUS
1: Isochronous PROFIBUS

Dependency:
Refer to: r0110, p0115
Refer to: A01223, A01224

Caution: Only current controller clock cycles (p0115 index 0) which are integers of 125 µs are permitted for isochronous mode.

Notice: p0092 only affects the automatic default for the clock cycles (p0115) in the drive. If the clock cycles are modified subsequently in expert mode (p0112 = 0), p0092 = 0 should be set so that the new values are not overwritten again by the automatic default when the parameters are downloaded. Current controller clock cycle values must continue to be integers of 125 µs for synchronous mode.

[5] = DRIVE-CLiQ socket X105

Dependency: Refer to: p0097, p0099

Note: Topology coding: abcd efgh hex
a = number of Active Line Modules
b = number of Motor Modules
c = number of motors
d = number of encoders (or the line supply voltage sensing for Active Line Modules)
e = number of additional encoders (or the line supply voltage sensing for Active Line Modules)
f = number of Terminal Modules
g = number of Terminal Boards
h = reserved
if the value 0 is displayed in all indices, then components are not detected via DRIVE-CLiQ.
If a value F hex occurs at a position of the coding (abcd efgh hex), then an overflow has occurred.

[2] = DRIVE-CLiQ socket X102
[3] = DRIVE-CLiQ socket X103
[4] = DRIVE-CLiQ socket X104
[5] = DRIVE-CLiQ socket X105

- Dependency:** The parameter can only be written into for p0097 = 0.
To perform an automatic device configuration run, an index of the device target topology must be set to the value of the device actual topology in r0098 for acknowledgement. An index of the device actual topology with a value other than 0 must be selected.
Refer to: p0097, r0098
Refer to: A01330
- Note:** The parameter can only be set to the values 0, the value of the actual device topology, the value of the actual device target topology and FFFFFFFF hex.
If the value 0 is displayed in all of the indices, then the system has still not been commissioned.
The value FFFFFFFF hex indicates that the topology was not generated by the automatic device configuration but was commissioned using the commissioning software (e.g. using parameter download).

	Min 0	Max 1	Factory setting 0
Description:	Defines whether the motor and drive converter power settings (e.g. rated motor power - p0307) are expressed in [kW] or [hp]. Depending on the selection, the rated motor frequency (p0310) is either set to 50 Hz or 60 Hz. The following applies for IEC drives: The power factor (p0308) should be parameterized. The following applies for NEMA drives: The efficiency (p0309) should be parameterized.		
Value:	0: IEC-Motor (50 Hz, SI units) 1: NEMA motor (60 Hz, US units)		
Dependency:	If p0100 is changed, all of the rated motor parameters are reset. Only then are possible unit changeovers made. The units of all motor parameters are changed that are involved in the selection of IEC or NEMA (e.g. r0206, p0307, p0316, r0333, r0334, p0341, p0344, r1493, r1969). Recommend.: When changing the sampling times of the current and speed controllers (also refer to p0115), then we recommend that after exiting commissioning (p0009 = 0) the controller settings are recalculated using p0340 = 4.

Dependency: It is prohibited to select a parameter value from p0112 if the associated current controller clock cycle cannot set (e.g. p0112 = 1 is not possible for a vector drive and PM340 power unit).
Refer to: p0092

Note: For p0112 = 0 (expert) the individual sampling times in p0115 can be adjusted.
p0112 = 1 cannot be set for a power unit type PM340 (refer to r0203) for vector drives.

p0113 Minimum pulse frequency, selection / f_puls min sel

VECTOR_G130/G150	Can be changed: C1(3)	Calculated: -	Access level: 3
0	Data type: FloatingPoint32	Dynamic index: -	Func. diagram: -
	P-Group: Closed-loop control	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 1.000 [kHz]	Max 2.000 [kHz]	Factory setting 2.000 [kHz]

Description: The current controller sampling time (p0115[0]) is pre-assigned by selecting the minimum pulse frequency.

Dependency: The parameter can only be changed with p0112 = 0 (expert). For isochronous operation (p0092 = 1) the parameter can only be set so that a current controller clock cycle of 125 µs is obtained as an integer number.

The required pulse frequency can be set in p1800 after commissioning (p0009 = p0010 = 0).

Refer to: p0112, r0114, p0115, p1800

Note: The current controller sampling time (p0115[0]) is set to the inverse value of twice the minimum pulse frequency. For p0113 = 1.0 kHz, p0115[0] = 500 µs is set, for p0113 = 2.0 kHz, p0115[0] = 250 µs is set. The current controller sampling time (p0115[0]), calculated from the pulse frequency, is set in a grid of 1.25 µs.

For a power unit type PM340 (refer to r0203), only the values 1.0 and 2.0 kHz can be set. 1.0 kHz can be set in order to achieve a current controller clock cycle of 500µs. However, in this case, the minimum pulse frequency p1800 is limited to 2 kHz.

Description:	Displays the recommended values (indices 0 and 1) for the minimum pulse frequency (p0113). If the system rejects a change to p0113 because the value to be used lies outside the permitted value range, then instead the recommended value from r0114 can be used.		
Index:	[0] = If only the actual drive is changed [1] = If all drives connected to the DRIVE-CLiQ line are changed [2] = 2. possible pulse frequency [3] = 3. possible pulse frequency [4] = 4. possible pulse frequency [5] = 5. possible pulse frequency [6] = 6. possible pulse frequency [7] = 7. possible pulse frequency [8] = 8. possible pulse frequency [9] = 9. possible pulse frequency		
Dependency:	Refer to: p0113		
Note:	After exiting commissioning (p0009 = p0010 = 0), the pulse frequencies calculated from the sampling time p115[0] are displayed in indices 1 to 9. If additional restrictions do not apply (e.g. due to having selected an output filter), these can be entered into p1800. The maximum pulse frequency of the power units was already taken into account in r0114. A value of 0 kHz does not define a recommended pulse frequency.

Description:	Sets the sampling times for the control loops. The default setting is made using p0112 and can only be individually changed for p0112 = 0 (expert).		
Recommend.:	When changing the sampling times of the current and speed controllers (also refer to p0115), then we recommend that after exiting commissioning (p0009 = 0) the controller settings are recalculated using p0340 = 4.		
Index:	[0] = Current controller [1] = Speed controller [2] = Flux controller [3] = Setpoint channel [4] = Position controller [5] = Positioning [6] = Technology controller		
Dependency:	The sampling times can only be separately set if p0112 is 0 (expert). If a sampling time is modified in the expert mode, then all of the sampling times with higher indices are automatically changed in the same ratio as the sampling time itself was changed. Slower time slices are only taken if the calculated sampling time is also permitted. Upper limit is 8 ms. Higher-level controls must be calculated in integral ratios to lower-level controls (e.g. p0115[1] = N * p0115[0]; where N is an integer number). The sampling time of the speed controller (p0115[1]) can have as a maximum a value of 800% of the current controller sampling time (p0115[0]). The sampling times for setpoint channel (p0115[3]), position controller (p0115[4]), positioning (p0115[5]) and technology controller (p0115[6]) must have at least 2x the value of the current controller sampling time (p0115[0]). If p0092 = 1 the sampling times p0115 and the pulse frequency p1800 are checked every time the parameters are downloaded, and reset to the initial values if necessary. This check can be deactivated by setting p0092 = 0 (making this setting does not affect isochronous PROFIBUS operation). Refer to: r0110, r0111, p0112		
Note:	For function modules that can be activated (e.g. technology controller), the parameters values are pre-assigned. The minimum current controller clock cycle is 250 µs, the maximum current controller clock cycle is 500 µs. For power unit type PM340 (r0203), only these current controller sampling times of 250 µs and 500 µs can be set.

	Min 0	Max 6	Factory setting 6
Description:	Sets the mode for the computing dead time of the current controller. 0: Offset (shifted) clocking, minimum computing dead time of each drive, automatic setting 1: Clocking at the same time, the dead time aligns itself to the dead time of the latest drive, automatic setting 2: Manual setting of the computing dead time, early transfer 3: Manual setting of the computing dead time, late transfer 4-6: As for 0-2, however, no early transfers are set for vectors		
Dependency:	Refer to: p0118 Refer to: A02100		
Note:	Re p0117 = 0: The times when the setpoints become effective for the individual controls is automatically and individually determined. Another computing dead time is set for each control (closed-loop) (p0118). Current is impressed for the individual controls without any offset with respect to time (improved EMC compatibility). Re p0117 = 1: The latest closed-loop control determines when the setpoints for each of the individual controls become active. The same computing dead time is set for each control (p0118). Current is impressed (flows) for the individual controls without any offset with respect to time. Re p0117 = 2: The computing dead time is manually set. The user must optimize the value in p0118. Re p0117 = 3: Only for internal Siemens use. Re p0117 = 4 ... 6: Behavior as for p0117 = 0 ... 2, however for vectors, the earliest times are not determined. The modified computing dead time mode is not effective until the drive unit is powered up again.

Notice: This information represents the characteristics/features of the power unit firmware. It does not provide information/data about the characteristics/features of the hardware (e.g. bit 06 = 1 means that although the firmware supports "liquid cooling", a power unit with liquid cooling does not have to be used).

Note: Re bit 09:
The Motor Module supports the internal armature short-circuit. The function is internally required for voltage protection (p1231 = 3).
Re bit 10:
The Motor Module supports the autonomous internal voltage protection. If the voltage protection function is internally activated (p1231 = 3) the Motor Module decides autonomously - using the DC link voltage - as to whether the short-circuit is activated.
Re bit 23:
The component supports the detection of current actual values (and the detection of valve close durations) with double clocking and phase shift.

	P-Group: Converter	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	65535	0
Description:	Sets the actual code number from r0200 to acknowledge the power unit being used. When commissioned for the first time, the code number is automatically transferred from r0200 into p0201.		
Dependency:	Refer to: F07815		

Notice: When p0201 = 10000, the rated power unit data is reloaded and dependent parameters are set (e.g. p0205, p0210, p0230, p0857, p1800). p0201 is then automatically assigned the value of r0200 if the code number of the power unit could be read. A warm start must be performed after this procedure (automatically if necessary).

Note: The parameter is used to identify when the drive is being commissioned for the first time.
The power unit commissioning can only be exited (p0201 = r0200), if the actual and acknowledged code numbers are identical (p0010 = 2). However, if the comparator in p9906 or p9908 is at 2 (low) or 3 (minimum), the power unit commissioning is automatically set to p0201 = r0200 upon exiting.
When the code number is changed, the connection voltage (p0210) is checked and, if necessary, adjusted.
For parallel circuit configurations, the parameter index is assigned to a power unit.

p0205 Power unit application / PU application

VECTOR_G130/G150	Can be changed: C2(1, 2)	Calculated: -	Access level: 2
0	Data type: Integer16	Dynamic index: -	Func. diagram: -
	P-Group: Converter	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0	7	6

Description: Overloading the load duty cycles applies under the prerequisite that before and after the overload, the drive converter is operated with its base load current - in this case, a load duty cycle of 300 s is used as basis.
For booksize drive units, the following applies:
Only the setting p0205 = 0 can be selected. In this particular case, the base load current has a load duty cycle of 150 % for 60 s and 176 % for 30 s.
For chassis units, the following applies:
The base load current for a slight overload condition is based on a load duty cycle 110 % for 60 s and 150 % for 10 s.
The base load current for a high overload condition is based on a load duty cycle 150 % for 60 s and 160 % for 10 s.

Value:
0: Load duty cycle with high overload for vector drives
1: Load duty cycle with low overload for vector drives
6: S1 duty cycle for servo drives (feed drive)
7: S6 duty cycle for servo drives (spindle drive)

Note: When the parameter is changed, all of the motor parameters and the control mode are pre-assigned according to the selected application.
The parameter has not influence when calculating the thermal overload.
p0205 can only be changed to the settings that are saved in the power unit EEPROM.
The parameter value is not reset when the factory setting is restored (see p0010 = 30, p0970).

	P-Group: Converter	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 1 [V]	Max 63000 [V]	Factory setting 600 [V]
Description:	Sets the drive unit supply voltage. AC/AC unit: The rms value of the phase-to-phase line supply voltage should be entered. DC/AC unit: The rated DC voltage of the connection busbar should be entered.		
Dependency:	Set p1254, p1294 (automatic detection of the V _{dc} switch-on levels) = 0. The switch-in thresholds of the V _{dc} _max controller are then directly determined using p0210. The parameter can be reduced to p0210 = 100 V if p0212 bit 0 has been set. Refer to: p0212		
Caution:	If the line supply voltage is higher than the entered value, the V _{dc} controller may be automatically deactivated in some cases to prevent the motor from accelerating. In this case, an appropriate alarm is output.		
Note:	Setting ranges for p0210 as a function of the rated power unit voltage: V _{rated} = 400 V: - p0210 = 380 ... 480 V (AC/AC), 510 ... 720 V (DC/AC) V _{rated} = 500 V: - p0210 = 500 ... 600 V (AC/AC), 675 ... 900 V (DC/AC) V _{rated} = 660 V ... 690 V: - p0210 = 660 ... 690 V (AC/AC), 890 ... 1035 V (DC/AC) V _{rated} = 500 V ... 690 V: - p0210 = 500 ... 690 V (AC/AC), 675 ... 1035 V (DC/AC) The pre-charging switch-in threshold for the DC link voltage (V _{dc}) is calculated from p0210: V _{dc_pre} = p0210 * 0.82 * 1.35 (AC/AC) V _{dc_pre} = p0210 * 0.82 (DC/AC)		

The undervoltage thresholds for the DC link voltage (V_{dc}) are calculated from p0210 as a function of the rated power unit voltage:

V_{rated} = 400 V:

- V_{min} = p0210 * 0.78 (AC/AC) > 330 V, p0210 * 0.60 (DC/AC) > 380 V

V_{rated} = 500 V:

- V_{min} = p0210 * 0.76 (AC/AC) > 410 V

V_{rated} = 660 V ... 690 V:

- V_{min} = p0210 * 0.82 (AC/AC) > 565 V, p0210 * 0.63 (DC/AC) > 650 V

V_{rated} = 500 V ... 690 V:

- V_{min} = p0210 * 0.82 (AC/AC) > 420 V, p0210 * 0.63 (DC/AC) > 480 V

	Min		Max	Factory setting
	-		-	0000 bin
Description: Configuration of the power unit.				
Bit field:	Bit	Signal name	1 signal	0 signal
	00	Reduced device supply voltage	Yes	No
Dependency:	Reduced supply voltages (bit 0 = 1) are only possible on booksize power units. Bit 0 = 1 can only be set if r0192 bit 22 = 1. Refer to: r0192, p0210			
Caution:	Re bit 00: Working with reduced input voltages deactivates undervoltage detection.			
				
Note:	Re bit 00 = 0: It is not possible to reduce the supply voltage in p0210. Re bit 00 = 1: With this setting the supply voltage in p0210 can be reduced to 100 V. Only operating mode p1300 = 19 is possible.			

p0230 Drive filter type, motor side / Drv filt type mot				
VECTOR_G130/G150	Can be changed: C2(1, 2)		Calculated: -	Access level: 1

	P-Group: Converter		Units group: -	Unit selection: -
	Not for motor type: -		Scaling: -	Expert list: 1
	Min 0		Max 4	Factory setting 0
Description:	Sets the type of the filter at the motor side.			
Value:	0:	No filter		
	1:	Motor reactor		
	2:	dv/dt filter		
	3:	Sine-wave filter, Siemens		
	4:	Sine-wave filter, third-party		

Dependency: The following parameters are influenced using p0230:
p0230 = 1:
--> p0233 (power unit, motor reactor) = filter inductance
p0230 = 3:
--> p0233 (power unit, motor reactor) = filter inductance
--> p0234 (power unit sine-wave filter capacitance) = filter capacitance
--> p0290 (power unit overload response) = inhibit pulse frequency reduction
--> p1082 (maximum speed) = Fmax filter / pole pair number
--> p1800 (pulse frequency) >= nominal pulse frequency of the filter
--> p1802 (modulator modes) = space vector modulation without overcontrol
--> p1811 (modulator configuration) = wobulation amplitude
--> p1909 (motor data identification, control word) = only Rs measurement
p0230 = 4:
--> p0290 (power unit overload response) = inhibit pulse frequency reduction
--> p1802 (modulator modes) = space vector modulation without overcontrol
--> p1811 (modulator configuration) = wobulation amplitude
--> p1909 (motor data identification, control word) = only Rs measurement
The user must set the following parameters according to the data sheet of the sine-wave filter and also the user must check whether they are permitted.
--> p0233 (power unit, motor reactor) = filter inductance
--> p0234 (power unit sine-wave filter capacitance) = filter capacitance
--> p1082 (maximum speed) = Fmax filter / pole pair number
--> p1800 (pulse frequency) >= nominal pulse frequency of the filter
Refer to: p0233, p0234, p0290, p1082, p1800, p1802

Note: if a filter type cannot be selected, then this filter type is not permitted for the Motor Module.
p0230 = 1:
The output frequency of booksize/blocksize power units with output reactors is restricted to 120 Hz.
p0230 = 2:
Chassis-type power units with dv/dt filter, depending on the rated pulse frequency, may only be operated with a maximum pulse frequency of p1800 = 2.5 kHz or 4 kHz. The output frequency is limited to 150 Hz.
p0230 = 3:
Sine-wave filters with a rated pulse frequency of 1.25 or 2.5 kHz should only be operated with a current controller sampling rate p0115[0] = 400 µs, sine-wave filters with a rated pulse frequency of 2 or 4 kHz with p0115[0] = 250 µs.
The sine-wave filter cannot be selected if the current controller sampling rate has not been appropriately set.
Chassis power units with sine-wave filter are limited to output frequencies of 115 Hz or 150 Hz.

	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.000 [mH]	Max 1000.000 [mH]	Factory setting 0.000 [mH]
Description:	Enter the inductance of a filter connected at the power unit output.		
Dependency:	This parameter is automatically preset when you select a filter via p0230 if a SIEMENS filter is defined for the power unit. Refer to: p0230		
Note:	When exiting the quick commissioning using p3900 = 1, the parameter value is set to the value of the defined SIEMENS filter or to zero. For this reason, the parameter value of a third-party filter only has to be entered outside the commissioning phase (p0010 = 0) and then the controller calculation (p0340 = 3) is carried out.		

p0234 Power unit sine-wave filter capacitance / PU sine filter C

VECTOR_G130/G150	Can be changed: C2(2), U, T	Calculated: -	Access level: 2

	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.000 [µF]	Max 1000.000 [µF]	Factory setting 0.000 [µF]
Description:	Enters the capacitance of a sine-wave filter connected at the power unit output.		
Dependency:	This parameter is automatically preset when you select a filter via p0230 if a SIEMENS filter is defined for the power unit. Refer to: p0230		
Note:	The parameter value includes the sum of all of the capacitances of a phase connected in series (phase - ground). When exiting the quick commissioning using p3900 = 1, the parameter value is set to the value of the defined SIEMENS filter or to zero. For this reason, the parameter value of a third-party filter only has to be entered outside the commissioning phase (p0010 = 0).

	Min 1	Max 3	Factory setting 1
Description:	Number of reactors connected at the power unit output.		
Dependency:	Refer to: p0230		
Caution:	If the number of motor reactors connected in series does not correspond to the parameter value, then this can result in an unfavorable control behavior.		
Note:	The parameter cannot be changed for chassis units and for p0230 = 1.

	P-Group: Converter	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min - [Ohm]	Max - [Ohm]	Factory setting - [Ohm]
Description:	Displays the internal resistance of the power unit (IGBT and line resistance).		
Note:	For a parallel circuit, the value corresponds to the resistance of a power unit. Index 0 refers to the first line filter from p0220[0]. Index 1 refers to the optional second line filter from p0220[1].		

p0249 Power unit cooling type / PU cool type

	P-Group: Converter	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0	Max 1	Factory setting 0
Description:	Sets the cooling type for booksize compact power units. This therefore defines whether for these power units, the internal air cooling is shut down and instead, the "Cold-Plate" cooling type is used.		

Value: 0: Air cooling int
1: Cold-Plate

Note: For booksize compact power units, there is a 4 at the 5th position in the Order No.
The parameter is irrelevant for all other power unit types.

Description: Displays the power unit fan operating hours.
The number of hours operated can only be reset to 0 in this parameter (e.g. after a fan has been replaced).

Dependency: Refer to: p0252

p0252 Maximum operating time power unit fan / PU fan t_oper max

	Min 0 [h]	Max 100000 [h]	Factory setting 40000 [h]

Description: Sets the maximum operating time of the power unit fan.
The pre-alarm (warning) is output 500 hours before this set value.
The monitoring is deactivated with p0252 = 0.

Dependency: Refer to: p0251

Note: For chassis units, the maximum operating time in the power unit parameter is set to 50000 via the factory setting.

p0255[0...1] Power unit contactor monitoring time / PU contactor t_mon

	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0 [ms]	Max 6500 [ms]	Factory setting 0 [ms]

Description: Sets the monitoring time for internal monitoring of the contactor feedback contacts.

Index: [0] = Pre-charge contactor
[1] = Bridging contactor

Dependency: Refer to: F30060, F30061

Note: This parameter is only effective for chassis power units with 3 AC line connection and line contactors.
A value of 0 deactivates the associated line contactor monitoring.

Description: Sets the response to a thermal overload condition of the power unit.
The following quantities can result in a response to thermal overload:
- heat sink temperature (r0037.0)
- chip temperature (r0037.1)
- power unit overload I2T (r0036)
Possible measures to avoid thermal overload:
- reduce the output current limit r0289 and r0067 (for closed-loop speed/velocity or torque/force control) or the output frequency (for V/f control) indirectly via the output current limit and the intervention of the current limiting controller).
- reduce the pulse frequency (only for vector control).
A reduction, if parameterized, is always realized after an appropriate alarm is output.

Value:

0:	Reduce output current or output frequency
1:	No reduction, shutdown when overload threshold is reached
2:	Reduce I_output or f_output and f_pulse (not using I2t)
3:	Reduce the pulse frequency (not using I2t)

Dependency: If a sine-wave filter is parameterized as output filter (p0230 = 3, 4), then only responses can be selected without pulse frequency reduction (p0290 = 0, 1).

If a fault or alarm is present, then r2135.13 or r2135.15 is set.

Refer to: r0036, r0037, r0108, p0108, p0230, r2135

Refer to: A05000, A05001, A07805

Caution: If the thermal overload of the power unit is not sufficiently reduced by the actions taken, the drive is always shut down. This means that the power unit is always protected irrespective of the setting of this parameter.

Note: The setting p0290 = 0, 2 is only practical if the load decreases with decreasing speed (e.g. for applications with variable torque such as for pumps and fans).

Under overload conditions, the current and torque limit are reduced, and therefore the motor is braked and forbidden speed ranges (e.g. minimum speed p1080 and suppression [skip] speeds p1091 ... p1094) can be passed through.

For p0290 = 2, 3, the I2t overload detection of the power unit does not influence the responses.

When the motor data identification routine is selected, p290 cannot be changed.

Description:	Selects the motor type or starts to read in the motor parameters for a motor with DRIVE-CLiQ (p0300 = 10000 or 10001, if there is a second data set). The following applies for p0300 < 10000: The first digit of the parameter value always defines the general motor type and corresponds to the third-party motor belonging to a motor list: 1 = Rotating induction motor 2 = Rotating synchronous motor 3 = Linear induction motor (reserved) 4 = Linear synchronous motor 5 = Synchronous motor separately-excited 7 = SIEMOSYN motor 8 = Reluctance motor The type information must be entered to filter motor-specific parameters and to optimize the operating characteristics and behavior. For example, for synchronous motors, power factor (p0308) is neither used nor displayed (in the BOP/AOP).		

Value:	0: No motor 1: Induction motor (rotating) 2: Synchronous motor (rotating, permanent-magnet) 5: Synchronous motor (separately excited) 7: SIEMOSYN motor 8: Reluctance motor 11: 1LA1 standard induction motor 12: 1LE2 standard induction motor (NEMA) 15: 1LA5 standard induction motor 16: 1LA6 standard induction motor 17: 1LA7 standard induction motor 18: 1LA8 / 1PQ8 standard induction motor 102: 1PH2 induction motor 104: 1PH4 induction motor 107: 1PH7 induction motor 108: 1PH8 induction motor 134: 1PM4 induction motor 136: 1PM6 induction motor 166: 1PL6 induction motor 283: 1FW3 synchronous motor 10000: Motor with DRIVE-CLiQ 10001: Motor with DRIVE-CLiQ 2nd data set
Dependency:	Motors, selection 206, 236, 237 cannot be operated (also not as motor with DRIVE-CLiQ). p0300 = 5 cannot be selected with SINAMICS G. When the motor type is changed, the code number in p0301 may be reset to 0. p0300 = 12 can only be selected for p0100 = 1 (NEMA). When selecting a motor type from the 1LA5 and 1LA7 series, parameters p0335, p0626, p0627 and p0628 of the thermal motor model are pre-assigned as a function of p0307 and p0311. Refer to: p0301
Caution:	A permanent-magnet synchronous motor cannot be operated with an SSI encoder without HTL/TTL track. A separately-excited synchronous motor can only be operated with an SSI encoder if this is used as the second encoder and an HTL/TTL encoder is used as the first encoder.
	
Caution:	If a catalog motor is selected (p0300 >= 100) and an associated motor code number (p0301), then the parameters, that are associated with this list cannot be changed (write protection). The write protection is canceled if the motor type p0300 is set to a non-Siemens motor that matches p0301 (e.g. p0300 = 2 for p0301 = 2xxxx). Write protection is automatically canceled when the results of motor data identification are copied to the motor parameters.
Notice:	If required, the list of motor codes/encoder codes can be found in the Appendix of the List Manual. For 1PQ8 motors (p0300 = 18) the fan type p0335 should be set to 5.
Note:	With p0300 = 10000, for a motor with DRIVE-CLiQ, the motor parameters are automatically downloaded, with p0300 = 10001, the motor parameters of a second data set (if available). If a motor type has not been selected (p0300 = 0), then the drive commissioning routine cannot be exited. A motor type with a value above p0300 >= 100 describes motors for which a motor parameter list exists. Motor types with a value below p0300 < 100 correspond to the selection of a third-party motor. When appropriately selected, this means that the motor parameters are pre-assigned the settings for a third-party motor. This also applies for parameters for a motor with DRIVE-CLiQ. In this case p0300 can only be set to p0300 = 10000 or 10001 (read motor parameters) or to the corresponding non-Siemens motor (first digit of the motor code number) in order to be able to cancel the write protection.

Description:	The parameter is used to select a motor from a motor parameter list. When changing the code number (with the exception to the value 0), all of the motor parameters are pre-assigned from the internally available parameter lists.		
Dependency:	Code numbers can only be selected for motor types that correspond to the motor type selected in p0300. For 1PH2, 1PH4, 1PH7, 1PM4, 1PM6, 1FT6 motors, code numbers are also possible, whose fourth decimal position is greater by a value of 1 or 2 than the matching motor type in p0300. For 1FE1 motors, the third decimal position can be higher by a value of 1. Refer to: p0300		
Notice:	If required, the list of motor codes/encoder codes can be found in the Appendix of the List Manual.		
Note:	The motor code number can only be changed if the matching catalog motor was first selected in p0300. For a motor with DRIVE-CLiQ, p0301 cannot be changed. In this case, p0301 is automatically written to the code number of the motor parameter read in (r0302) if p0300 is set to 10000. When selecting a catalog motor (p0300 >= 100), drive commissioning can only be exited if a code number is selected.

Caution:	This parameter is automatically preset for motors from the motor list (p0301). When selecting a catalog motor, this parameter cannot be changed (write protection). Information in p0300 should be carefully observed when removing write protection.		
Notice:	If p0305 is changed during quick commissioning (p0010 = 1), then the maximum current p0640 is pre-assigned accordingly. This is not the case when commissioning the motor (p0010 = 3). If the rated motor current exceeds twice the maximum drive converter current (r0209), then the maximum current is reduced due to the current harmonics that increase overproportionally (r0067).		
Note:	When the parameter value is entered the connection type of the motor (star-delta) must be taken into account.		

p0306[0...n] Number of motors connected in parallel / Motor qty

Description:	Number of motors that can be operated in parallel using one motor data set. Depending on the motor number entered, internally an equivalent motor is calculated. The following should be carefully observed for motors connected in series: The following rating plate data should only be entered for one motor: - resistances and inductances: p0350 ... p0361 - currents: p0305, p0320, p0323, p0325, p0329, p0389, p0390, p0391, p0392 - power ratings: p0307 - masses/moments of inertia: p0341, p0344 All other parameters take into account the replacement/equivalent motor (e.g. r0331, r0333).		
Dependency:	Refer to: r0331		
Caution: 	The motors to be connected in parallel must be of the same type and size (same order no. (MLFB)). The mounting regulations when connecting motors in parallel must be carefully maintained! Especially for synchronous motors, the pole position of motors that are rigidly coupled with one another (mechanically) must be identical. The number of motors set must correspond to the number of motors that are actually connected in parallel. After changing p0306, it is imperative that the control parameters are adapted (e.g. using automatic calculation with p0340 = 1).		
Notice:	If p0306 is changed during quick commissioning (p0010 = 1), then the maximum current p0640 is appropriately pre-assigned. This is not the case when commissioning the motor (p0010 = 3).		
Note:	Only operation with V/f characteristic makes sense if more than 10 identical motors are connected in parallel. Separately-excited synchronous motors must not be connected in parallel. Synchronous and reluctance motors that are not coupled with one another align themselves when the pulses are switched in. If the motors have different load levels, then equalization currents flow between the motors.

Description:	Sets the motor pole pair number. Values: p0314 = 1: 2-pole motor p0314 = 2: 4-pole motor etc.		

- Dependency:** For p0314 = 0, the pole pair number is automatically calculated from the rated frequency (p0310) and the rated speed (p0311) and displayed in r0313.

p0318[0...n] Motor stall current / Mot I_standstill

VECTOR_G130/G150	Can be changed: C2(3)	Calculated: -	Access level: 4
	Data type: FloatingPoint32	Dynamic index: MDS	Func. diagram: 8017
	P-Group: Motor	Units group: -	Unit selection: -
	Not for motor type: ASM, REL, FEM	Scaling: -	Expert list: 1
	Min 0.00 [Arms]	Max 10000.00 [Arms]	Factory setting 0.00 [Arms]

Description: Sets the stall current for synchronous motors (p0300 = 2xx).

Caution: This parameter is automatically preset for motors from the motor list (p0301). When selecting a catalog motor, this parameter cannot be changed (write protection). Information in p0300 should be carefully observed when removing write protection.

Note: The parameter is used for the I2t monitoring of the motor (refer to p0611).
This parameter is not used for induction motors (p0300 = 1xx).

p0320[0...n] Motor rated magnetizing current/short-circuit current / Mot I_magRated

VECTOR_G130/G150	Can be changed: C2(3), U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dynamic index: MDS	Func. diagram: 5722
	P-Group: Motor	Units group: -	Unit selection: -
	Not for motor type: REL, FEM	Scaling: -	Expert list: 1
	Min 0.000 [Arms]	Max 5000.000 [Arms]	Factory setting 0.000 [Arms]

- Description:** Induction motors:
Sets the rated motor magnetizing current.
For p0320 = 0.000 the magnetizing current is internally calculated and displayed in r0331.
Synchronous motors:
Sets the rated motor short-circuit current.

Caution: This parameter is automatically preset for motors from the motor list (p0301). When selecting a catalog motor, this parameter cannot be changed (write protection). Information in p0300 should be carefully observed when removing write protection.

Note: The magnetization current p0320 for induction motors (not for catalog motors) is reset when quick commissioning is exited with p3900 > 0.
VECTOR: If, for induction motors, the magnetizing current p0320 is changed outside the commissioning phase (p0010 > 0), then the magnetizing inductance p0360 is changed so that the EMF r0337 remains constant.

p0322[0...n]		Maximum motor speed / Mot n_max	
VECTOR_G130/G150	Can be changed: C2(1, 3)	Calculated: -	Access level: 2

	P-Group: Motor	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.0 [rpm]	Max 210000.0 [rpm]	Factory setting 0.0 [rpm]
Description:	Sets the maximum motor speed.		
Dependency:	Refer to: p1082		
Caution:	This parameter is automatically preset for motors from the motor list (p0301). When selecting a catalog motor, this parameter cannot be changed (write protection). Information in p0300 should be carefully observed when removing write protection.		
Notice:	If p0322 is changed during quick commissioning (p0010 = 1), then the maximum speed p1082, which is also associated with quick commissioning, is pre-assigned accordingly. This is not the case when commissioning the motor (p0010 = 3).		

p0323[0...n]		Maximum motor current / Mot I_max	
VECTOR_G130/G150	Can be changed: C2(1, 3)	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dynamic index: MDS	Func. diagram: 5722
	P-Group: Motor	Units group: -	Unit selection: -
	Not for motor type: ASM, FEM	Scaling: -	Expert list: 1
	Min 0.00 [Arms]	Max 20000.00 [Arms]	Factory setting 0.00 [Arms]
Description:	Sets the maximum permissible motor current (e.g. demagnetizing current for synchronous motors).		
Caution:	This parameter is automatically preset for motors from the motor list (p0301). When selecting a catalog motor, this parameter cannot be changed (write protection). Information in p0300 should be carefully observed when removing write protection.		
Notice:	If p0323 is changed during quick commissioning (p0010 = 1), then the maximum current p0640 is pre-assigned accordingly. This is not the case when commissioning the motor (p0010 = 3).		
Note:	This parameter is automatically preset for motors from the motor list (p0301). The parameter has no effect for induction motors. The parameter has not effect for synchronous motors if a value of 0.0 is entered. The user-selectable current limit is entered into p0640.		

p0324[0...n]		Winding maximum speed / Winding n_max

	Not for motor type: -	Scaling: -	Expert list: 1	
	Min 0.0 [rpm]	Max 210000.0 [rpm]	Factory setting 0.0 [rpm]	
Description:	Sets the electrical maximum speed of the winding.			
Dependency:	Refer to: p1082			
Caution:	This parameter is automatically preset for motors from the motor list (p0301). When selecting a catalog motor, this parameter cannot be changed (write protection). Information in p0300 should be carefully observed when removing write protection.			
Notice:	If p0324 is changed during quick commissioning (p0010 = 1), then the maximum speed p1082, which is also associated with quick commissioning, is pre-assigned appropriately. This is not the case when commissioning the motor (p0010 = 3).			

p0325[0...n]	Motor pole position identification current, 1st phase / Mot PolID I 1st ph		
VECTOR_G130/G150	Can be changed: U, T	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dynamic index: MDS	Func. diagram: -
	P-Group: Motor	Units group: -	Unit selection: -
	Not for motor type: ASM, REL, FEM	Scaling: -	Expert list: 1
	Min 0.000 [Arms]	Max 10000.000 [Arms]	Factory setting 0.000 [Arms]
Description:	Sets the current for the 1st phase of the two-stage technique for pole position identification routine. The current of the 2nd phase is set in p0329. The two-stage technique is selected with p1980 = 4.		
Dependency:	Refer to: p0329, p1980, p1982, r1984, r1985, r1987, p1990		
Notice:	When the motor code (p0301) is changed, it is possible that p0325 is not pre-assigned. p0325 can be pre-assigned using p0340 = 3.		
Note:	The value is automatically pre-assigned for the following events: - For p0325 = 0 and automatic calculation of the closed-loop control parameters (p0340 = 1, 2, 3). - for quick commissioning (p3900 = 1, 2, 3).		
p0327[0...n]	Optimum motor load angle / Mot phi_load opt		
VECTOR_G130/G150	Can be changed: C2(3), U, T	Calculated: -	Access level: 3

	P-Group: Motor	Units group: -	Unit selection: -
	Not for motor type: ASM, REL, FEM	Scaling: -	Expert list: 1
	Min 0.0 [°]	Max 135.0 [°]	Factory setting 90.0 [°]
Description:	Sets the optimum load angle for synchronous motors with reluctance torque (e.g. 1FE ... motors). This parameter has no significance for induction motors. SERVO: The load angle is measured at 1.5 x rated motor current. VECTOR: The load angle is measured at the rated motor current.		
Caution:	This parameter is automatically preset for motors from the motor list (p0301). When selecting a catalog motor, this parameter cannot be changed (write protection). Information in p0300 should be carefully observed when removing write protection.		
Note:	For synchronous motors without reluctance torque, a angle of 90 degrees must be set. When quick commissioning is exited with p3900 > 0, then the parameter is reset if a catalog motor has not been selected (refer to p0300).		
p0328[0...n]	Motor reluctance torque constant / Mot kT_reluctance		
VECTOR_G130/G150	Can be changed: C2(3), U, T	Calculated: -	Access level: 3

	Not for motor type: ASM, REL, FEM	Scaling: -	Expert list: 1
	Min -1000.00 [mH]	Max 1000.00 [mH]	Factory setting 0.00 [mH]
Description:	Sets the reluctance torque constant for synchronous motors with reluctance torque (e.g. 1FE ... motors). This parameter has no significance for induction motors.		
Caution:	This parameter is automatically preset for motors from the motor list (p0301). When selecting a catalog motor, this parameter cannot be changed (write protection). Information in p0300 should be carefully observed when removing write protection.		
Note:	For synchronous motors without reluctance torque, the value 0 must be set.		

p0329[0...n]	Motor pole position identification current / Mot PolID current		
VECTOR_G130/G150	Can be changed: C2(3), U, T	Calculated: -	Access level: 3

	Not for motor type: ASM, REL, FEM	Scaling: -	Expert list: 1
	Min 0.00 [Arms]	Max 10000.00 [Arms]	Factory setting 0.00 [Arms]
Description:	Sets the current for the pole position identification routine. For a two-stage technique, the current is set for the second phase.		
Dependency:	Refer to: p0325, p1980, p1982, r1984, r1985, r1987, p1990		
Caution:	This parameter is automatically preset for motors from the motor list (p0301). When selecting a catalog motor, this parameter cannot be changed (write protection). Information in p0300 should be carefully observed when removing write protection.		
r0330[0...n]	Rated motor slip / Mot slip_rated		
VECTOR_G130/G150	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dynamic index: MDS	Func. diagram: -
	P-Group: Motor	Units group: -	Unit selection: -
	Not for motor type: PEM, REL, FEM	Scaling: -	Expert list: 1
	Min - [Hz]	Max - [Hz]	Factory setting - [Hz]
Description:	Displays the rated motor slip.		
Dependency:	The rated slip is calculated from the rated frequency, rated speed and number of pole pairs. Refer to: p0310, p0311, r0313		
Note:	The parameter is not used for synchronous motors (p0300 = 2xx).		
r0331[0...n]	Actual motor magnetizing current/short-circuit current / Mot I_mag_rtd act		
VECTOR_G130/G150	Can be changed: -	Calculated: -	Access level: 3

	P-Group: Motor	Units group: -	Unit selection: -
	Not for motor type: REL, FEM	Scaling: -	Expert list: 1
	Min - [Arms]	Max - [Arms]	Factory setting - [Arms]
Description:	Induction motor: Displays the rated magnetizing current from p0320. For p0320 = 0, the internally calculated magnetizing current is displayed. Synchronous motor: Displays the rated short-circuit current from p0320.		
Dependency:	If p0320 was not entered, then the parameter is calculated from the rating plate parameters.		
Note:	In the case of multi-motor operation r0331 is increased by the factor p0306 compared to p0320.		

r0332[0...n] Rated motor power factor / Mot cos_phi_rated

VECTOR_G130/G150	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dynamic index: MDS	Func. diagram: -
	P-Group: Motor	Units group: -	Unit selection: -
	Not for motor type: PEM, REL	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-

Description: Displays the rated power factor for induction motors.
For IEC motors, the following applies (p0100 = 0):
For p0308 = 0, the internally-calculated power factor is displayed.
For p0308 > 0, this value is displayed.
For NEMA motors, the following applies (p0100 = 1):
For p0309 = 0, the internally-calculated power factor is displayed.
For p0309 > 0, this value is converted into the power factor and displayed.

Dependency: If p0308 is not entered, the parameter is calculated from the rating plate parameters.

Note: The parameter is not used for synchronous motors (p0300 = 2xx).

r0333[0...n] Rated motor torque / Mot M_rated

VECTOR_G130/G150	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dynamic index: MDS	Func. diagram: -
	P-Group: Motor	Units group: 7_4	Unit selection: p0100
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [Nm]	- [Nm]	- [Nm]

Description: Displays the rated motor torque.

Dependency: IEC drives (p0100 = 0): unit Nm
NEMA drives (p0100 = 1): unit lbf ft

Note: For induction and reluctance motors, r0333 is calculated from p0307 and p0311.
For synchronous motors, r0333 is calculated from p0305, p0316, p0327 and p0328. The result can deviate from the input in p0312. If p0316 = 0, then r0333 = p0312 is displayed.
In the case of multi-motor operation r0333 is increased by the factor p0306 compared to the rated torque of an individual motor.

r0334[0...n] Actual motor-torque constant / Mot kT act

VECTOR_G130/G150	Can be changed: -	Calculated: -	Access level: 3
	Data type: FloatingPoint32	Dynamic index: MDS	Func. diagram: -
	P-Group: Motor	Units group: 28_1	Unit selection: p0100
	Not for motor type: ASM, REL, FEM	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	- [Nm/A]	- [Nm/A]	- [Nm/A]

Description: Displays the torque constant of the synchronous motor used.

Dependency: IEC drives (p0100 = 0): unit Nm / A
NEMA drives (p0100 = 1): unit lbf ft / A
Refer to: p0316

Note: This parameter is not used for induction motors (p0300 = 1xx).
For synchronous motors, parameter r0334 = p0316 is displayed. When p0316 = 0, r0334 is calculated from p0305 and p0312 or p0305, p0307, and p0311.

p0335[0...n]	Motor cooling type / Motor cooling type		
VECTOR_G130/G150	Can be changed: C2(1, 3), T	Calculated: -	Access level: 1

	P-Group: Motor	Units group: -	Unit selection: -
	Not for motor type: PEM, REL, FEM	Scaling: -	Expert list: 1
	Min 0	Max 128	Factory setting 0
Description:	Sets the motor cooling system used.		
Value:	0: Non-ventilated 1: Forced cooling 2: Liquid cooling 4: Non-ventilated and internal fan 5: Forced cooling and internal fan 6: Liquid cooling and internal fan 128: No fan		
Dependency:	For 1LA5 and 1LA7 motors (refer to p0300), the parameter is preset as a function of p0307 and p0311.		
Caution:	This parameter is automatically preset for motors from the motor list (p0301). When selecting a catalog motor, this parameter cannot be changed (write protection). Information in p0300 should be carefully observed when removing write protection.		
Note:	The parameter influences the thermal 3-mass motor model. 1LA1 and 1LA8 motors are characterized by the fact that they have an internal rotor fan. This "internal cooling" lies within the motor frame and is not visible. Air is not directly exchanged with the motor ambient air. For 1PQ8 motors, p0335 should be set to 5 as these motors are force-ventilated motors. 1LA7 motors, frame size 56 are operated without fan.		
r0336[0...n]	Actual rated motor frequency / Mot f_{rated act}

	Min - [Hz]	Max - [Hz]	Factory setting - [Hz]
Description:	Displays the rated frequency of the motor. For p0310 > 0, this value is displayed.		
Dependency:	Refer to: p0311, p0314		
Note:	For p0310 = 0 or for synchronous motors, the rated motor frequency r0336 is calculated from the rated speed and the pole pair number. For p0310 > 0, this value is displayed (not for synchronous motors).

	Min - [Vrms]	Max - [Vrms]	Factory setting - [Vrms]
Description:	Displays the rated motor voltage		
Note:	For induction motors (p0300 = 1xx) the parameter is set to p0304. For synchronous motors, parameter r0339 = p0304 is displayed. If p0304 = 0, then r0339 is calculated from p0305 and p0316.

Note:

p0340 = 1 contains the calculations of p0340 = 2, 3, 4, 5 without overwriting the motor parameters from the Siemens motor lists (p0301 > 0).

p0340 = 2 calculates the motor parameters (p0350 ... p0360), but only if it does involve a Siemens catalog motor (p0301 = 0).

p0340 = 3 contains the calculations of p0340 = 4, 5.

p0340 = 4 only calculates the controller parameters.

p0340 = 5 only calculates the controller limits.

When quick commissioning is exited using p3900 > 0, p0340 is automatically set to 1.

At the end of the calculations, p0340 is automatically set to 0.

If the STARTER commissioning software writes a 3 into p0340 when "downloading to target device", then this corresponds to a "complete calculation of the motor/control parameters without equivalent circuit diagram data". The same calculations are carried out as for p0340 = 1, however, without the equivalent circuit diagram parameters of the motor (p0340 = 2), the motor moment of inertia (p0341) and the motor weight (p0344).

For third-party linear synchronous motors (p0300 = 4) equivalent circuit diagram data are not calculated (p0340 = 2).

Description:	Sets the motor weight.		
Dependency:	IEC drives (p0100 = 0): unit kg NEMA drives (p0100 = 1): unit lb		
Caution:	This parameter is automatically preset for motors from the motor list (p0301). When selecting a catalog motor, this parameter cannot be changed (write protection). Information in p0300 should be carefully observed when removing write protection.		
Note:	The parameter influences the thermal 3 mass model of the induction motor. The parameter is not used for synchronous motors (p0300 = 2xx).

Description:	Displays the rated motor starting time. This time corresponds to the time from standstill up to reaching the motor rated speed and the acceleration with motor rated torque (r0333).		
Dependency:	Refer to: r0313, r0333, r0336, p0341, p0342		
p0346[0...n]	Motor excitation build-up time / Mot t_excitation		
VECTOR_G130/G15 0	Can be changed: C2(3), U, T Data type: FloatingPoint32 P-Group: Motor Not for motor type: - Min 0.000 [s]	Calculated: CALC_MOD_REG Dynamic index: MDS Units group: - Scaling: - Max 20.000 [s]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.000 [s]
Description:	Sets the excitation build-up time of the motor. This involves the delay time between enabling the pulses and enabling the ramp-function generator. The induction motor is magnetized during this time.		
Caution:	If there is insufficient magnetization under load or if the acceleration rate is too high, then an induction motor can stall (refer to the note). This is especially true for encoderless vector control or V/f control.		
			
Notice:	If the parameter is set to 0 s for separately-excited synchronous motors (p0300 = 5), then an excitation current set-point is generated even if the drive is powered down. In the base speed range, this is the no-load excitation current (p0389). In the field-weakening range, the value is reduced with the inverse value of the actual speed. An excitation current setpoint is not generated during demagnetizing (p0347) and if an encoder fault is detected.		
Note:	The parameter is calculated using p0340 = 1, 3. For induction motors, the result depends on the rotor time constant (r0384). If this time is excessively reduced, this can result in an inadequate magnetizing of the induction motor. This is the case if the current limit is reached while building up magnetizing. For induction motors, the parameter cannot be set to 0 s (internal limit: 0.1 * r0384). For permanent-magnet synchronous motors and vector control, the value depends on the stator time constant (r0386). Here, it defines the time to establish the current for encoderless operation immediately after the pulses have been enabled.

VECTOR_G130/G15 0	Can be changed: C2(3), U, T Data type: FloatingPoint32 P-Group: Motor Not for motor type: - Min 0.000 [s]	Calculated: CALC_MOD_REG Dynamic index: MDS Units group: - Scaling: - Max 20.000 [s]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0.000 [s]
Description:	Sets the demagnetizing time (for induction motors) after the inverter pulses have been canceled. The inverter pulses cannot be switched in (enabled) within this delay time.		
Note:	The parameter is calculated using p0340 = 1, 3. For induction motors, the result depends on the rotor time constant (r0384). if this time is shortened too much, then this can result in an inadequate demagnetizing of the induction motor and in an overcurrent condition when the pulses are subsequently enabled (only when the flying restart function is activated and the motor is rotating).

Dependency:	Refer to: p0304, p0305, p0310		
Note:	The reference parameter for resistances of the rated motor impedance $Z = p0304 / (1.732 * p0305)$ is in the % units system. Inductances are converted into a resistance using the factor $2 * \pi * p0310$. Description:	Sets the stator resistance of the motor at ambient temperature p0625.		
Dependency:	Refer to: p0625, r1912		
Caution:	This parameter is automatically preset for motors from the motor list (p0301). When selecting a catalog motor, this parameter cannot be changed (write protection). Information in p0300 should be carefully observed when removing write protection.		
Note:	The motor identification routine determines the stator resistance from the total stator resistance minus the cable resistance (p0352).

	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.00000 [Ohm]	Max 120.00000 [Ohm]	Factory setting 0.00000 [Ohm]
Description:	Resistance of the power cable between the Motor Module and motor.		
Dependency:	Refer to: p7003		
Caution:	The cable resistance should be entered prior to motor data identification. If it is used subsequently, the difference by which p0352 was changed must be subtracted from the stator resistance p0350 or motor data identification must be repeated.		
			
Notice:	Parallel circuits with one winding system (p7003 = 0): p0352 includes the feeder cable resistance of an individual Motor Module. The total feeder cable resistance is obtained from p0352 divided by the number of activated Motor Modules (refer to r0395). Parallel circuits with multi-winding system (p7003 = 1): p0352 includes the complete feeder cable resistance and is directly added to the stator resistance (refer to r0395).		

Note: The parameter influences the temperature adaptation of the stator resistance.
 The motor identification sets the cable resistance to 20% of the measured total resistance if p0352 is zero at the time that the measurement is made. If p0352 is not zero, then the value is subtracted from the measured total stator resistance to calculate stator resistance p0350. In this case, p0350 is a minimum of 10% of the measured value.
 Exception:
 For parallel circuit configurations with one winding system (p07003 = 0), the cable resistance is directly measured. It is important to note that only the component of an individual Motor Module is entered into p0352.
 The cable resistance is reset when quick commissioning is exited with p3900 > 0.

Permanent-magnet synchronous motors (PESM): The saturation characteristic describes the mapping of the stator quadrature axis current onto the stator quadrature axis flux. The parameter sets the fourth stator quadrature axis flux as a [%] referred to the product of the unsaturated quadrature inductance (p0356) and the rated motor current.		
Dependency:	The following applies for the flux values: p0362 < p0363 < p0364 < p0365 The following applies for the stator quadrature axis flux values (PESM): 20% < p0362 < p0363 < p0364 < p0365 Refer to: p0369		
Caution:	For permanent-magnet synchronous motors (PESM): If the parameters are not set as specified, i.e. not in ascending order and to more than 20%, the unsaturated quadrature inductance (p0356) is always used for quadrature axis flux calculation purposes.		
Note:	For induction motors, p0365 = 100 % corresponds to the rated motor flux. For separately-excited synchronous motors p0365 = 100% corresponds to an induced terminal voltage with the magnitude of the rated motor voltage (under no-load conditions at the synchronous speed). With permanent-magnet synchronous motors, p0362 = 100% corresponds to the product of the unsaturated quadrature inductance (p0356) and the rated motor current (p0305). When quick commissioning is exited with p3900 > 0, then the parameter is reset if a catalog motor has not been selected (refer to p0300).

Description:	The magnetic cross coupling of the motor's d and q axes caused by saturation (current-dependent) leads to an angle offset affecting the axis system d'q'; this decouples the magnetic quantities. The angle offset can be described as a third-order polynomial function of the load current consumed: $\text{phiOffset} = f(C1 \cdot i_q + C3 \cdot i_q^3)$ This parameter is the coefficient C3; it describes the cubic load impact effect.

Caution: An encoder type with p0400 < 9999 defines an encoder for which there is an encoder parameter list. When selecting a catalog encoder (p0400 < 9999) the parameters from the encoder parameter list cannot be changed (write protection). To remove write protection, the encoder type should be set to a third-party encoder (p0400 = 9999).

Notice: If required, the list of motor codes/encoder codes can be found in the Appendix of the List Manual.

Note: The connected encoder can be identified by setting p0400 to 10000 or 10100. This assumes that the encoder supports this method, which is possible in the following cases: Motor with DRIVE-CLiQ, encoder with EnDat interface, DRIVE-CLiQ encoder.

The encoder data (e.g. pulse number p0408) can only be changed when p0400 = 9999.

When using an encoder with track A/B and zero pulse, as standard, fine synchronization is not set using a zero mark. If, for a synchronous motor, fine synchronization is to be realized using a zero mark, then the following must be executed:

- set p0400 to 9999

- set p0404.15 to 1

Prerequisite:

Coarse synchronization must be selected (e.g. pole position identification) and the zero pulse of the encoder must be either mechanically or electronically (p0431) adjusted to the pole position.

For p0400 = 10000 the following applies:

If an identification is not possible, then p0400 is set to 0.

For p0400 = 10100 the following applies:

If an identification is not possible, p0400 remains set to 10100 until it becomes possible.

Caution:

This parameter is automatically preset for encoders from the encoder list (p0400).

When selecting a catalog encoder, this parameter cannot be changed (write protection). Information in p0400 should be carefully observed when removing write protection.

Notice:

If an SSI encoder (bit 9 = 1) is used as motor encoder for permanent-magnet synchronous motors, then this is only permissible in conjunction with an additional A/B track (bit 4 = 1 or bit 5 = 1).

Note: ZM: Zero mark
SMC: Sensor Module Cabinet

If a technique to determine the commutation information/data has not been selected (e.g. track C/D, Hall sensor), and the encoder pulse number is an integer multiple of the pole number, then the following applies:
The track A/B is adjusted to match the magnetic position of the motor.

Re bit 01, 02 (absolute encoder, multiturn encoder):
These bits can only be selected for EnDat encoders, SSI encoders or DRIVE-CLiQ encoders.

Re bit 10 (DRIVE-CLiQ encoder):
This bit is only used for the large-scale integrated DRIVE-CLiQ encoders that provide their encoder data directly in DRIVE-CLiQ format without converting this data. This bit is not, therefore, set for first-generation DRIVE-CLiQ encoders.

Re bit 12 (equidistant zero mark):
The zero marks occur at regular intervals (e.g. rotary encoder with 1 zero mark per revolution or linear encoder with constant zero mark distance).
The bit activates monitoring of the zero mark distance (p0424/p0425, linear/rotary) or in the case of the linear encoder with 1 zero mark and p0424 = 0 zero mark monitoring is activated.

Re bit 13 (irregular zero mark):
The zero marks occur at irregular intervals (e.g. a linear scale with only 1 zero mark in the traversing range). The zero mark distance is not monitored.

Re bit 14 (distance-coded zero mark):
The distance (clearance) between two or several consecutive zero marks allows the absolute position to be calculated.

Re bit 15 (commutation with zero mark):
Only applicable for synchronous motors. For distance-coded zero marks, the following applies:
The phase sequence of the C/D track (if available) must be the same as the phase sequence of the encoder (A/B track).
The phase sequence of the Hall signal (if available) must be the same as the phase sequence of the motor. Further, the position of the Hall sensor must be mechanically adjusted to the motor EMF.
The fine synchronization is only started after two zero marks have been passed.

Description:		Sets the number of rotations that can be resolved for a rotary encoder with activated position tracking of the measuring gear.								
Dependency:		This parameter is only of significance for an absolute encoder (p0404.1 = 1) with activated position tracking (p0411.0 = 1) and for an incremental encoder with activated position tracking (p0411.3 = 1).								

Note: The resolution that is set must be able to be represented using r0483.
 For rotary axes/modulo axes, the following applies:
 p0411.0 = 1:
 This parameter is preset with p0421 and can be changed.
 p0411.3 = 1:
 The parameter value is preset to the highest possible value. The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).
 For linear axes, the following applies:
 p0411.0 = 1:
 This parameter is pre-assigned with p0421, expanded by 6 bits for multiturn information (maximum number of overflows) and cannot be changed.
 p0411.3 = 1:
 The parameter value is preset to the highest possible value. The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).

	Min 0.00	Max 4294967300.00	Factory setting 0.00

Description: Sets a tolerance window for position tracking.
 After the system is powered up, the difference between the saved position and the actual position is determined, and depending on this, the following is initiated:
 Difference within the tolerance window --> The position is reproduced as a result of the encoder actual value.
 Difference outside the tolerance window --> An appropriate message is output.

Dependency: Refer to: F31501, F32501, F33501

Caution: Rotation, e.g. through a complete encoder range is not detected.

Note: The value is entered in integer (complete) encoder pulses.
 For p0411.0 = 1, the value is automatically pre-assigned quarter of the encoder range.
 Example:
 $\text{Quarter of the encoder range} = (\text{p0408} * \text{p0421}) / 4$
 It is possible that the tolerance window may not be able to be precisely set due to the data type (floating point number with 23 bit mantissa).

Note:	The parameter applies for the following process data: - Gx_XIST1 - Gx_XIST2 for reference mark or flying measurement The fine resolution specifies the fraction between two encoder pulses. Depending on the physical measurement principle, an encoder pulse can be broken down into a different number of fractions (e.g. squarewave encoder: 2 bit = resolution 4, sin/cos encoder: Typical 11 bit = resolution 2048). For a squarewave encoder, with the factory setting, the least significant bits have the value zero, i.e. they do not supply any useful information. For especially high quality measuring systems, the fine resolution must be increased corresponding to the available accuracy.

Note:

Re bit 17 (burst oversampling):

Displays whether burst oversampling has been activated.

Re bit 18 (continuous oversampling):

Displays whether continuous oversampling has been activated.

Re bit 19 (safety position actual value sensing):

Displays whether the safety encoder position is sent in the cyclic telegram.

Re bit 20 (speed calculation mode):

If bit = 0 the speed is calculated via edge time measurement with extrapolation between edges. In this mode the speed actual value 0 measuring time can be set in p0453.

If bit = 1 the speed is calculated via incremental difference without extrapolation. In this mode p0453 is irrelevant.

Re bit 21 (zero mark tolerance):

If bit = 1 there is no fault response (F3x100) if the number of track pulses between two zero pulses does not match the configured number on one occasion. If the next zero mark is correct, no fault occurs.

Re bit 22 (rotor position adaptation):

If bit = 1 correction might take several steps (+/- 1 quadrant per revolution) if the zero mark arrived in a tolerance bandwidth (+/- 1/12 of the electrical revolution).

Re bit 23 (deselection commutation with zero mark):

Only possible with the Sensor Module property "Commutation with zero mark can be deselected" (p0458.23 = yes).

This should only be set for encoders that have not been adjusted.

Re bit 24 (commutation with selected zero mark):

Sets commutation to selected zero mark.

Re bit 25 (disconnection of encoder power supply on parking):

If activated, the encoder power supply is disconnected completely on parking (0 V), regardless of whether the operating voltage is 5 V or 24 V. If not activated, the encoder power supply is not disconnected on parking (although the 24 V operating voltage is reduced to 5 V).

Re bit 27 (extrapolation SSI position value):

Sets the interpolation of the position values from the SSI encoder.

Re bit 28 (cubic correction):

Sets whether cubic correction is activated for the A-B analog signals.

Re bit 29 (phase correction):

Sets whether phase correction is activated for the A-B analog signals.

Re bit 30 (amplitude correction):

Sets whether amplitude correction is activated for the A-B analog signals.

Re bit 31 (offset correction):

Sets whether offset correction is activated for the A-B analog signals.

		Not for motor type: -	Scaling: -	Expert list: 1
		Min -180.00 [°]	Max 180.00 [°]	Factory setting 0.00 [°]
Description:	Sets the angular commutation offset.			
Dependency:	The value is taken into account in r0094. Refer to: r0094, r1778			
Caution:	When the firmware is upgraded from V2.3 to V2.4 or higher, the value must be reduced by 60° if all the following conditions are fulfilled: - The motor is a synchronous motor (p0300 = 2, 2xx, 4, 4xx). - The encoder is a resolver (p0404.23 = 1). - The actual speed value is inverted (p0410.0 = 1).			
Notice:	The angular commutation offset cannot be generally taken from other drive systems. As a minimum - the sign of the offset determined for SIMODRIVE 611 digital and SIMODRIVE 611 universal must be reversed for SINAMICS (p0431 (SINAMICS) = -p1016 (SIMODRIVE)).			

Note: Angular commutation offset, angular difference between electrical position of encoder and flux position.
 For p0404.5 = 1 (track C/D) the following applies:
 The angular offset in p0431 acts on track A/B, the zero mark on track C/D.
 For p0404.6 = 1 (Hall sensor) the following applies:
 The angular offset in p0431 acts on track A/B and the zero mark.

Description:	Sets the position and level of the error bit in the SSI protocol.		
Notice:	The bit may only be positioned before (p0446) or after (p0448) the absolute value in the SSI protocol.		

Note: Value = dcba
ba: Position of the error bit in the protocol (0 ... 63).
c: Level (0: Low level, 1: High level).
d: Status of the evaluation (0: Off, 1: On with 1 error bit, 2: On with 2 error bits ... 9: On with 9 error bits).
For several error error bits, the following applies:
- the position specified under ba and the additional bits are assigned increasing consecutively.
- the level set under c applies to all error bits.
Example:
p0434 = 1013
--> The evaluation is switched in and the error bit is at position 13 with a low level.
p0434 = 1113
--> The evaluation is switched in and the error bit is at position 13 with a high level.

Description: Sets the position and level of the alarm bit in the SSI protocol.
Notice: The bit may only be positioned before (p0446) or after (p0448) the absolute value in the SSI protocol.
Note: Value = dcba
ba: Position of the alarm bit in protocol (0 ... 63).
c: Level (0: Low level, 1: High level).
d: State of the evaluation (0: Off, 1: On).
Example:
p0435 = 1014
--> The evaluation is switched in and the alarm bit is at position 14 with a low level.
p0435 = 1114
--> The evaluation is switched in and the alarm bit is at position 14 with a high level.

Description: Sets the position and parity of the parity bit in the SSI protocol.
Notice: The bit may only be positioned before (p0446) or after (p0448) the absolute value in the SSI protocol.
Note: Value = dcba
ba: Position of the parity bit in the protocol (0 ... 63).
c: Parity (0: even, 1: uneven).
d: State of the evaluation (0: Off, 1: On).
Example:
p0436 = 1015
--> The evaluation is switched in and the parity bit is at position 15 with even parity.
p0436 = 1115

31	Analog unipolar track monitoring	Yes	No	-																																																																	
Dependency:	Refer to: p0430, r0459																																																																				
Note:	A value of zero is displayed if an encoder is not present. Re bit 00: When the data logger (trace) is activated, in the case of a fault, data before and after the event are recorded (traced) and saved in files on the non-volatile memory medium. Experts can then evaluate this data. Re bit 01: If bit = 0, the zero mark is evaluated by ANDing tracks A and B and the zero mark. For bit = 1, the zero mark is evaluated depending on the direction of rotation detected. For a positive direction of rotation, the positive edge of the zero mark is considered and for a negative direction of rotation, the negative edge of the zero mark. Re bit 02: If the bit is set, in the event of a deviation less than the tolerance window for the zero mark (p4681, p4682), the pulses per revolution are corrected. If the bit is not set, encoder fault F3x131 is triggered. Re Bit 04 and Bit 05: The current hardware only supports 1x or 4x signal evaluation. Bit 5/4 = 0/0: Signal evaluation per period, 4x. Bit 5/4 = 1/0: Signal evaluation per period, 4x. Bit 5/4 = 0/1: Signal evaluation per period, 1x. Bit 5/4 = 1/1: Illegal setting. Re bit 06: If the function is active, when dn/dt monitoring responds, the speed actual value is internally frozen for a time equivalent to two current controller clock cycles. The rotor position continues to be integrated. The actual value is then re-enabled after this time has expired. Re bit 07: If the bit is set, the encoder pulses which have not been corrected are added to r4688 at the zero mark. Re bit 11: If the bit is set, within a certain time grid the Sensor Module checks whether the fault cause is still present. This enables the Module to switch from the fault state to the operating state and provide valid actual values automatically. The faults are displayed until the user acknowledges them.																																																																				

Re bit 20:

If the bit is set, the bandwidth of the analog filter for SMx10 (resolver) and SMx20 (sin/cos encoder) can be set via parameter p4660.

Re bit 26:

Track monitoring is deactivated for the square-wave encoders when the bit is set, even if the monitoring function is selected in p405.2.

Re bit 28:

Monitoring of the difference between incremental and absolute position in the case of linear encoders.

Re bit 29:

When the bit is set, the EnDat encoder is initialized under a certain speed and, therefore, with high accuracy. If initialization at a higher speed is requested, fault F31151, F32151, or F33151 is output.

Re bit 31:

When monitoring is active, the levels of the individual track signals and the corresponding inverted track signals are monitored separately.

	28	EnDat linear encoder monitoring incremental/absolute	Yes	No	-
	29	EnDat encoder initialization with high accuracy	Yes	No	-
	31	Analog unipolar track monitoring	Yes	No	-

Dependency: Refer to: p0430, r0459

Note: A value of zero is displayed if an encoder is not present.

Re bit 00:

When the data logger (trace) is activated, in the case of a fault, data before and after the event are recorded (traced) and saved in files on the non-volatile memory medium. Experts can then evaluate this data.

Re bit 01:

If bit = 0, the zero mark is evaluated by ANDing tracks A and B and the zero mark.

For bit = 1, the zero mark is evaluated depending on the direction detected. For a positive direction, the positive edge of the zero mark is considered and for a negative direction, the negative edge of the zero mark.

Re bit 02:

If the bit is set, in the event of a deviation less than the tolerance window for the zero mark (p4681, p4682), the pulses per revolution are corrected. If the bit is not set, encoder fault F3x131 is triggered.

Re Bit 04 and Bit 05:

Bit 5/4 = 0/0: Signal evaluation per period, 4x.

Bit 5/4 = 1/0: Signal evaluation per period, 4x.

Bit 5/4 = 0/1: Signal evaluation per period, 1x.

Bit 5/4 = 1/1: Illegal setting.

Re bit 06:

If the function is active, when dn/dt monitoring responds, the velocity actual value is internally frozen for a time equivalent to two current controller clock cycles. The rotor position continues to be integrated. The actual value is then re-enabled after this time has expired.

Re bit 07:

If the bit is set, the encoder pulses detected as faulty between two zero marks are accumulated (r4688).

Re bit 29:

When the bit is set, the EnDat encoder is initialized under a certain velocity and, therefore, with high accuracy. If initialization at a higher velocity is requested, fault F31151, F32151, or F33151 is output.

Re bit 31:

When monitoring is active, the levels of the individual track signals and the corresponding inverted track signals are monitored separately.

p0438[0...n]		Squarewave encoder filter time / Enc t_filt				
ENCODER, VECTOR_G130/G15 0	Can be changed:	C2(4)	Calculated:	-	Access level:	3
	Data type:	FloatingPoint32	Dynamic index:	EDS, p0140	Func. diagram:	-
	P-Group:	Encoder	Units group:	-	Unit selection:	-
	Not for motor type:	-	Scaling:	-	Expert list:	1
	Min	0.00 [µs]	Max	100.00 [µs]	Factory setting	0.64 [µs]
Description:	Sets the filter time for a squarewave encoder. The hardware of the squarewave encoder only supports the following values: No filtering 0.04 µs 0.64 µs 2.56 µs 10.24 µs 20.48 µs					
Dependency:	Refer to: r0452					
Notice:	If the filter time is too long, the track signals A/B/R may be suppressed and the appropriate messages output.					
Note:	The most suitable filter time depends on the number of pulses and maximum speed of the square-wave encoder. The filter time is automatically corrected to the next value when entering a non-specified value. In this case, no message is output. The effective filter time is displayed in r0452.					

p0439[0...n]		Encoder ramp-up time / Enc ramp-up time				
ENCODER, VECTOR_G130/G15 0	Can be changed:	C2(4)	Calculated:	-	Access level:	3

	Not for motor type:	-	Scaling:	-	Expert list:	1
	Min	0 [ms]	Max	65535 [ms]	Factory setting	0 [ms]
Description:	Ramp-up time of encoder. The encoder supplies stable track signals once this time has elapsed.					
Caution:	This parameter is automatically preset for encoders from the encoder list (p0400). When selecting a catalog encoder, this parameter cannot be changed (write protection). Information in p0400 should be carefully observed when removing write protection.

Description:	Copies the actual serial number of the encoder belonging to this Encoder Data Set (EDS) to p0441 ... p0445. Example: For p0440[0] = 1, the serial number of the encoder belonging EDS0 is copied to p0441[0] ... p0445[0].

Note:	For encoders with serial number, encoder replacement is monitored in order to request angular commutation calibration (adjustment) for motor encoders and absolute calibration for direct measuring systems with absolute value data. The serial number, which from then onwards is used for monitoring purposes, can be transferred using p0440. In the following cases, copying is automatically started in the following cases: 1.) When commissioning 1FT6, 1FK6, 1FK7 motors. 2.) When writing into p0431. 3.) For p1990 = 1. p0440 is automatically set to 0 when the copying has been completed. In order to permanently accept the copied values, it is necessary to save in a non-volatile fashion (p0977).

Re bit 14, 15:

r0481.14 = 1 and r0481.15 = 0 can have one of the following causes:

- the encoder is parked.
- the encoder is deactivated.
- the encoder is being commissioned.
- no parameterized encoder available.
- encoder data set is being changed over.

r0481.14 = 1 and r0481.15 = 1 has the following significance:

An encoder error has occurred and the encoder position actual value (Gn_XIST1) is invalid.

Note:	Refer to the encoder interface for PROFIdrive. The terminal must be set as input. For p0495 = 0 (factory setting), the encoder zero mark is evaluated as zero mark. For p0495 > 0, the following applies: Depending on the direction of motion, the positive or negative edge at the appropriate input is evaluated. - increasing position actual values (r0482) --> the 0/1 edge is evaluated. - decreasing position actual values (r0482) --> the 1/0 edge is evaluated. Only one zero mark is supported. If function 2, 3 or 4 is selected, this results in a fault message in Gn_ZSW. The inversion of the inputs via p0490 affects the function "referencing with equivalent zero mark". This is the reason that the edge evaluation is interchanged as a function of the direction of motion. An input can only be assigned to one encoder as measuring probe 1, 2 or equivalent zero mark. Description:	Sets the technology application. The parameter influences the calculation of open-loop and closed-loop control parameters that is e.g. initiated using p0578.		
Value:	0: Standard drive (VECTOR) 1: Pumps and fans 2: Sensorless closed-loop control down to f = 0 (passive loads)		
Dependency:	Refer to: p2175, p2177		
Note:	The calculation of parameters dependent on the technology application can be called up as follows: - when exiting quick commissioning using p3900 > 0 - when writing p0340 = 1, 3, 5 - when writing p0578 = 1 For p0500 = 0 and when the calculation is initiated, the following parameters are set: p1574 = 10 V (for separately-excited synchronous motors: 20 V) p1750 bit 2 = 0 p1802 = 4 (SVM/FLB without overcontrol) p1803 = 106 % For p0500 = 1 and when the calculation is initiated, the following parameters are set: p1574 = 2 V (for separately-excited synchronous motors: 4 V) p1750 bit 2 = 0 p1802 = 9 (edge modulation), if r0192 bit 0 = 1 p1802 = 4, if r0192 bit 0 = 0 or parallel circuit configuration with single-winding system (p7003) p1803 = 106 %		

For p0500 = 2 and when the calculation is initiated, the following parameters are set:

p1574 = 2 V (for separately-excited synchronous motors: 4 V)

p1750 bit 2 = 1: Sensorless closed-loop control of induction motors effective up to a frequency of zero.

This operating mode is possible for passive loads. These include applications where the load does not generate regenerative torque when breaking away and the motor comes to a standstill (zero speed) itself when the pulses are inhibited.

p1802 = 4 (SVM/FLB without overcontrol)

p1803 = 106 %

The setting of p1750 is only relevant for induction motors.

p1802 and p1803 are only changed, in all cases, if a sine-wave output filter (p0230 = 3, 4) has not been selected.

Description: The parameter is used to select a bearing type.
0 = No selection
1 = Manual entry
101 = STANDARD
102 = PERFORMANCE
103 = HIGH PERFORMANCE
104 = ADVANCED LIFETIME
If the bearing type changes the bearing code number (p0531) is pre-assigned accordingly.

Dependency: Refer to: p0301, p0531

Caution: If a valid bearing type (p0530) is entered, the parameters in the bearing list cannot be changed (write protection).
Write protection is canceled if bearing type 1 is entered.

Note: p0530 cannot be changed on a motor with DRIVE-CLiQ.

Description: The parameter is used to display and enter the bearing code number. It is pre-assigned automatically (from the parameter lists which are available internally) when p0301 and p0530 are entered and cannot be changed (write protection). The information in p0530 should be observed when removing write protection.
When changing the bearing code number (except in the case of changing the value to 0), all of the bearing parameters are pre-assigned from the parameter lists which are available internally.

Dependency: Refer to: p0301, p0530

Note: p0531 cannot be changed on a motor with DRIVE-CLiQ.

	Min 0.0 [rpm]	Max 210000.0 [rpm]	Factory setting 0.0 [rpm]
Description:	Sets the maximum motor bearing speed.		
Dependency:	Refer to: p1082		
Caution:	This parameter is pre-assigned in the case of motors from the motor list (p0301) if a bearing type (p0530) or a bearing code (p0531) is selected. When selecting a catalog motor, this parameter cannot be changed (write protection). The information in p0530 should be observed when removing write protection.		
Notice:	If p0532 is changed during quick commissioning (p0010 = 1), then the maximum speed p1082, which is also associated with quick commissioning, is pre-assigned appropriately. This is not the case when commissioning the motor (p0010 = 3).

Note: p0570 defines the number of entries (starting at index 0) for which the inhibit should apply. p0572 can be used to define for which drive data sets the inhibit list should apply.
If a motor data set is entered into a parameter number, then this is not overwritten as soon as only one drive data set refers to the motor data set (p0186).

Description:	Inhibits the calculation of reference parameters (e.g. p2000) when automatically calculating the motor and closed-loop control parameters (p0340, p3900).		
Value:	0: No 1: Yes		
Notice:	The inhibit for the reference value calculation is canceled when new motor parameters (e.f. p0305) are entered and only one drive data set exists (p0180 = 1). This is the case during initial commissioning. Once the motor and control parameters have been calculated (see p3900, p0340), the inhibit for the reference value calculation is automatically reactivated.		
Note:	0: The automatic calculation (p0340, p3900) overwrites the reference parameters. 1: The automatic calculation (p0340, p3900) does not overwrite the reference parameters.

	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.000 [s]	Max 600.000 [s]	Factory setting 0.000 [s]
Description:	Sets the timer for the alarm threshold for the motor temperature monitoring function. This timer is started when the temperature alarm threshold (p0604) is exceeded. If the timer expires before the temperature in the meantime falls below the alarm threshold, the fault F07011 is output. If the temperature fault threshold (p0605) is prematurely exceeded before the timer has expired, then fault F07011 is immediately output. As long as the motor temperature has still not exceeded the fault threshold and the alarm thresholds have again been undershot, the fault can be acknowledged.		
Dependency:	Refer to: p0604, p0605 Refer to: F07011, A07910		
Note:	With p0606 = 0 s, the timer is deactivated and only the fault threshold is effective. KTY sensor: When setting the minimum value, the timer is disabled and a fault is not output until p0605 is exceeded. PTC sensor, bimetallic NC contact: The timer minimum value has no special significance.

------------------	--	--	--

Description: Sets the system response when the motor temperature reaches the alarm threshold.

Value:
 0: No response only alarm no reduction of I_max
 1: Alarm with reduction of I_max and fault
 2: Alarm and fault no reduction of I_max

Dependency: Refer to: p0601, p0604, p0605
Refer to: F07011, A07910

Note: The I_max reduction is not executed for PTC (p0601 = 1) or bimetallic NC contact (p0601 = 4).
The I_max reduction results in a lower output frequency.

Description:	Sets the winding time constant. The time constant specifies the warm-up time of the cold stator winding when loaded with the motor standstill current up until a temperature rise of 63 % of the continuously permissible winding temperature has been reached.				
Dependency:	This parameter is only used for synchronous motors (p0300 = 2xx). Refer to: r0034, p0612, p0615 Refer to: F07011, A07012, A07910				
Caution:	This parameter is automatically preset from the motor database for motors from the motor list (p0301). When selecting a catalog motor, this parameter cannot be changed (write protection). Information in p0300 should be carefully observed when removing write protection.				
Note:	When parameter p0611 is reset to 0, then this switches out the thermal I2t motor model (also refer to p0612). If no temperature sensor is parameterized, then the ambient temperature for the thermal motor model is referred to p0625.

Dependency:	Refer to: r0034, p0611, p0615																		
Note:	Re bit 00: This bit is only used for permanent-magnet synchronous motors (p0300 = 2xx). It is only possible to switch in thermal I2t monitoring with a time constant greater than zero (p0611 > 0). Re bit 01: This bit is used to activate/deactivate the thermal motor model for induction motors.

	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0	Max 2	Factory setting 1
Description: Sets the thermal adaptation of the stator/primary section resistance and rotor/secondary section resistance according to r0395 and r0396.			
Value: 0: No thermal adaptation of stator and rotor resistances 1: Resistances adapted to the temperatures of the thermal model 2: Resistances adapted to the measured stator winding temperature			
Note: For p0620 = 1, the following applies: The stator resistance is adapted using the temperature in r0035 and the rotor resistance together with the model temperature in r0633. For p0620 = 2, the following applies: The stator resistance is adapted using the temperature in r0035. If applicable, the rotor temperature for adapting the rotor resistance is calculated from the stator temperature (r0035) as follows: $\theta_{R} = (r0628 + r0625) / (r0627 + r0625) * r0035$			

p0621[0...n] Identification stator resistance after restart / Rst_ident Restart			
VECTOR_G130/G150 (n/M)	Can be changed: C2(3), T	Calculated: -	Access level: 2
	Data type: Integer16	Dynamic index: MDS	Func. diagram: -
	P-Group: Motor	Units group: -	Unit selection: -
	Not for motor type: PEM, REL, FEM	Scaling: -	Expert list: 1
	Min 0	Max 2	Factory setting 0
Description: Selects the identification of the stator resistance after booting the Control Unit (only for vector control). The identification is used to measure the actual stator resistance and from the ratio of the result of motor data identification (p0350) to the matching ambient temperature (p0625) the actual mean temperature of the stator winding is calculated. The result is used to initialize the thermal motor model. p0621 = 1: Identification of the stator resistance only when the drive is powered up for the first time (pulse enable) after booting the Control Unit. p0621 = 2: Identification of the stator resistance every time the drive is powered up (pulse enable).			
Value: 0: No temperature identification 1: Temperature identification after restart 2: Temperature identification after each power-up			

- Dependency:**
- perform motor data identification (see p1910) with cold motor.
 - enter ambient temperature at time of motor data identification in p0625.
- Refer to: p0622, r0623
- Notice:**
- The calculated stator temperature can only be compared with the measured value of a temperature sensor (KTY) to a certain extent, as the sensor is usually the warmest point of the stator winding, whereas the measured value of identification reflects the mean value of the stator winding.
- Furthermore this is a short-time measurement with limited accuracy that is performed during the magnetizing phase of the induction motor.
- Note:**
- The measurement is carried out:
- For induction motors
 - When vector control is active (see p1300)
 - If a temperature sensor (KTY) has not been connected
 - When the motor is at a standstill when switched on
- When a flying restart is performed on a rotating motor, the temperatures of the thermal motor model are set to a third of the overtemperatures. This occurs only once, however, when the CU is booted (e.g. after a power failure). If identification is activated, the magnetizing time is determined via p0622 and not via p0346. Quick magnetizing (p1401.6) is de-energized internally and alarm A07416 is displayed. The speed is enabled after completion of the measurement.

p0622[0...n] Motor excitation time for Rs_ident after powering up again / t_excit Rs_id			
VECTOR_G130/G15 0 (n/M)	Can be changed: C2(3), U, T	Calculated: CALC_MOD_REG	Access level: 3
	Data type: FloatingPoint32	Dynamic index: MDS	Func. diagram: -
	P-Group: Motor	Units group: -	Unit selection: -
	Not for motor type: PEM, REL, FEM	Scaling: -	Expert list: 1
	Min 0.000 [s]	Max 20.000 [s]	Factory setting 0.000 [s]
Description:	Sets the excitation time of the motor for the stator resistance identification after powering up again (restart).		
Dependency:	Refer to: p0621, r0623		
Note:	For p0622 < p0346 the following applies: If identification is activated, the magnetizing time is influenced by p0622. The speed is enabled after measurement is complete, but not before the time in p0346 has elapsed (see r0056 bit 4). The time taken for measurement also depends on the settling time of the measured current. For p0622 >= p0346 the following applies: Parameter p0622 is internally limited to the magnetizing time p0346, so that p0346 represents the maximum possible magnetizing time during identification. The entire measurement period (magnetizing plus measurement settling time plus measuring time) will always be greater than p0346.

	Not for motor type: -	Scaling: -	Expert list: 1
	Min -100.0 [K]	Max 100.0 [K]	Factory setting 0.0 [K]
Description:	Sets the temperature offset for the PT100 measured value. If there is a difference between the motor temperature displayed in r0035 and the actual motor temperature, this offset can be entered in this parameter, thereby compensating for the difference.		
Dependency:	Refer to: p0600, p0601, p0602		
Note:	The parameter only takes effect with the following settings: - Temperature sensor of the power unit detected (p0600 = 11). - Sensor type PT100 selected (p0601 = 5). If the resistance in series with the PT100 (e.g. the cable resistance of the feeder cable) is known, the following conversion formula must be used: Offset in p0624 = Measured resistance in ohms x 2.5 K/Ohm Example: Measured cable resistance = 2 Ohm --> 2 Ohm x 2.5 K / Ohm = 5.0 K

Description:	Sets the current limit.		
Dependency:	Refer to: r0209, p0323		
Note:	The parameter is part of the quick commissioning (p0010 = 1); this means that it is appropriately pre-assigned when changing p0305, p0323 and p0338. The current limit p0640 is limited to r0209 and p0323. The limit to p0323 is not realized if a value of zero is entered there. The resulting current limit is displayed in r0067 and if required, r0067 is reduced by the thermal model of the Motor Module. The torque and power limits (p1520, p1521, p1530, p1531) matching the current limit are automatically calculated when exiting the quick commissioning using p3900 > 0 or using the automatic parameterization with p0340 = 3, 5. For VECTOR the following applies (p0107): p0640 is limited to 4.0 * p0305. p0640 is pre-assigned for the automatic self commissioning routine (e.g. to 1.5 * p0305, with p0305 = r0207[1]). p0640 must be entered when commissioning the system. This is the reason that p0640 is not calculated by the automatic parameterization when exiting the quick commissioning (p3900 > 0). For SERVO the following applies (p0107): p0640 is pre-assigned as follows using the automatic parameterization (p0340 = 1, p3900 > 0) taking into account the limits r0209 and r0323: - for induction motors: p0640 = 1.5 * p0305 - for synchronous motors: p0640 = p0338

Description:	Sets the overvoltage protection for synchronous motors in the field-weakening range.		
Value:	0: No measure 1: Voltage Protection Module (VPM)		
Dependency:	Refer to: p0316, p1082, p1231, p9601, p9801 Refer to: F07906, F07907		
Notice:	When the speed limiting is removed, the user is responsible for implementing a suitable overvoltage protection.		
Note:	In the field-weakening range, synchronous motors can, when a fault condition exists, generate high DC link voltages. The following possibilities exist to protect the drive system from being destroyed due to overvoltage: - limit the maximum speed (p1082) without any additional protection. The maximum speed without protection is calculated as follows: Rotary motors: $p1082 \text{ [rpm]} \leq 11.695 * p0297/p0316 \text{ [Nm/A]}$ Linear motors: $p1082 \text{ [m/min]} \leq 73.484 * p0297/0316 \text{ [N/A]}$ - use a Voltage Protection Module (VPM) in conjunction with the function "Safe Torque Off" (p9601, p9801). When a fault condition exists, the VPM short-circuits the motors. During the short-circuit, the pulses must be suppressed - this means that the terminals for the function "Safe Torque Off" must be connected to the VPM. - activating the internal voltage protection (IVP) with p1231 = 3.

Description:

Displays the actual value at the digital inputs.

This means that the actual input signal can be checked at terminal DI x or DI/DO x prior to switching from the simulation mode (p0795.x = 1) to terminal mode (p0795.x = 0). The input signal at terminal DI x is displayed in bit x of r0721.

Description: Displays the access authority at the digital outputs.

Bit = 1:

The control has access authority to the digital output via PROFIBUS or direct access.

Bit = 0:

The drive has access authority to the digital output or the digital input/output is not set as digital output or is not available.

Description:	Sets the signal source for the feedback signal of the contactors when changing over motors. There is a fixed inter-relationship between energizing the contactor and the feedback signal. Example: A changeover is to be made between MDS0 (motor 0) and MDS1 (motor 1). The contactors should be switched using bit 4 (contactor 0) and 5 (contactor 1). The changeover should be made with an interconnection of the feedback signal. Implementation: MDS0: p0827[0] = 4, interconnect output to switch contactor 0 to r0830.4, p0831[4] = "input, feedback signal, contactor 0" MDS1: p0827[1] = 5, interconnect output to switch contactor 1 to r0830.5, p0831[5] = "input, feedback signal, contactor 1" The following sequence applies when changing over from MDS0 to MDS1: 1. The status bit r0830.4 is deleted. When the feedback signal (p0831[4]) is connected, the system waits until the feedback signal "contactor open" is displayed. If the feedback signal is not connected, then the system waits for the switch-off interlocking time of 320 ms. 2. The status bit r0830.5 is set. If the feedback signal (p0831[5]) is connected, the system waits until the feedback signal "contactor closed" is displayed. If the feedback signal is not connected, then the system waits for the switch-on interlocking time of 160 ms.

When the bit is set and the motor has to be changed over, then p0827 must be set differently in the appropriate motor data sets.

Re bit 02:
The bit defines whether, for an EDS changeover, the status signal Gn_ZSW.14 is suppressed (parking encoder active).

Re motor changeover to running motor:

Note:

This parameter is only supplied with up-to-date values if data set changeover has been selected or is running.

Re bit 00:

The signal is only influenced when a motor changeover is set via p0827 (unequal bit numbers).

Re bit 01:

The signal is only influenced when an encoder changeover is set via p0187, p0188, or p0189.

Re bit 02:

A data set changeover is delayed by the time required for the internal parameter calculation.

Re bit 04:

A data set changeover is only carried out when the armature short circuit is not activated.

Re bit 05:

The following applies for SERVO:

A data set changeover is only carried out when pole position identification, encoder adjustment, motor data identification, and rotating measurement are not running.

The following applies for VECTOR:

A data set changeover is only carried out when pole position identification is not running.

Re bit 06:

A data set changeover is only carried out when the friction characteristic record is not running.

Re bit 07 (VECTOR only):

A data set changeover is only carried out when rotating measurement is not running.

Re bit 08 (VECTOR only):

A data set changeover is only carried out when motor data identification is not running.

Re bit 10:

A motor changeover is set with p0833.1 = 1. It can only be carried out when the application performs pulse suppression.

Re bit 11:

A motor changeover is set with p0833.0 = 1. The pulses are only enabled when the "Motor changeover feedback" signal is detected.

Description:	Sets the monitoring time for the power unit. The following applies for infeeds and drives: The monitoring time is started after an 0/1 edge of the ON/OFF1 command. If the power unit does not return a READY signal within the monitoring time, then fault F06000 (infeeds) or F07802 (drives) is output. For drives, the following also applies: After the pulse enable (operation enabled, p0852), the monitoring time is re-started. If the infeed does not signal ready to the drive within the monitoring time (using BI: p0864 of the drive), fault F07840 is initiated.		
Dependency:	Refer to: F07802, F07840, F30027		
Notice:	The maximum time to pre-charge the DC link is monitored in the power unit and cannot be changed. The maximum duration of the pre-charging depends on the power class and the power unit design. The monitoring time for the pre-charging is started after the ON command (BI: p0840 = 0/1 signal). Fault F30027 is output when the maximum pre-charging duration is exceeded.		
Note:	The factory setting for p0857 depends on the power class and the design of the power unit. The monitoring time for the ready signal of the power unit includes the time to pre-charge the DC link and, if relevant, the de-bounce time of the contactors. If an excessively low value is entered into p0857, then after enable, this results in the corresponding fault.

	Min	Max	Factory setting
	1	126	126

Description: Displays or sets the PROFIBUS address for PROFIBUS interface on the Control Unit.

The address can be set as follows:

1) Using the address switch on the Control Unit.

--> p0918 can then only be read and displays the selected address.

--> A change only becomes effective after a POWER ON.

2) Using p0918

--> Only if the address 00 hex, 7F hex, 80 hex, or FF hex has been set using the address switch.

--> The address is saved in a non-volatile fashion using the function "copy from RAM to ROM".

--> A change only becomes effective after a POWER ON.

Note: Permissible PROFIBUS addresses: 1 ... 126 (01 hex ... 7E hex)

Address 126 is used for commissioning.

Every PROFIBUS address change only becomes effective after a POWER ON.

The parameter is not influenced by setting the factory setting.

Description:

Sets the required procedure to execute a hardware reset for the drive unit.

Value:

- 0: Inactive
- 1: Hardware-Reset immediate
- 2: Hardware reset preparation
- 3: Hardware reset after cyclic communication has failed

Danger:

It must be absolutely ensured that the system is in a safe condition.
The memory card of the Control Unit must not be accessed.

Notice:

For SIMOTION or SINUMERIK with integrated SINAMICS, the hardware reset acts on the complete system and depends on the state of the control.

Note:

Re value = 1:
Reset is immediately executed and communications interrupted.
After communications have been established, check the reset operation (refer below).

Re value = 2:
Help to check the reset operation.
Firstly, set p0972 = 2 and then read back. Secondly, set p0972 = 1 (it is possible that this request is possibly no longer acknowledged). The communication is then interrupted.
After communications have been established, check the reset operation (refer below).

Re value = 3:
The reset is executed after interrupting cyclic communication. This setting is used to implement a synchronized reset by a control for several drive units.
If the cyclic communication is active for both PROFIdrive interfaces, then the reset is executed after completing both cycle communications.
After communications have been established, check the reset operation (refer below).
To check the reset operation:
After the drive unit has been restarted and communications have been established, read p0972 and check the following:
p0972 = 0? --> The reset was successfully executed.
p0972 > 0? --> The reset was not executed.

Note: After all of the parameters have been reset to their factory setting, the system must be commissioned for the first time again.

Resetting or loading is realized in the non-volatile memory.

Procedure:

1. Set p0009 = 30 (parameter reset).

2. Set p0976 to "required value". The system is rebooted.

p0976 is automatically set to 0 and p0009 is automatically set to 1 after this has been carried out.

Description:	This parameter is an image of p0101 in conformance with PROFIdrive. Parameters p0101 and p0978 contain the following information: 1) The same number of drive objects 2) The same drive objects In this sense, they are consistent. Difference between p0101 and p0978: p0978 can be re-sorted and a zero inserted in order to identify those drive objects that participate in the process data exchange and to define their sequence in the process data exchange. Drive objects that are listed after the first zero, are excluded from the process data exchange. For p0978, in addition, the value 255 can be inserted a multiple number of times. p0978[n] = 255 means: The drive object is visible for the PROFIBUS master and is empty (without any actual process data exchange). This allows cyclic communications of a PROFIBUS master with unchanged configuring to the drive units with a lower number of drive objects.		
Dependency:	Refer to: p0101, p0971, p0977		
Note:	p0978 cannot be changed when the drive system is first commissioned. The reason for this is that at this time the actual topology has still not been acknowledged (p0099 is still not equal to r0098 and p0009 is set to 0).

VECTOR_G130/G150	Can be changed: U, T	Calculated: -	Access level: 3

	P-Group: Setpoints	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min -	Max -	Factory setting 0110 bin

Description: Sets the configuration for the motorized potentiometer.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Data save active	Yes	No	-
	01	Automatic mode, ramp-function generator active	Yes	No	-
	02	Initial rounding-off active	Yes	No	-
	03	Save in NVRAM active	Yes	No	-

Notice: The following prerequisites must be fulfilled in order to be able to save the setpoint (Bit 03 = 1) in a non-volatile fashion:

- Firmware with V2.3 or higher.
- Control Unit 320 (CU320) with hardware version C or higher (module with NVRAM).

Note:

Re bit 00:
0: The setpoint for the motorized potentiometer is not saved and after ON is entered using p1040.
1: The setpoint for the motorized potentiometer is saved after OFF and after ON set to the saved value. In order to save in a non-volatile fashion, bit 03 should be set to 1.

Re bit 01:
0: Without ramp-function generator in the automatic mode (ramp-up/ramp-down time = 0).
1: With ramp-function generator in the automatic mode.
For manual operation (0 signal via BI: p1041), the ramp-function generator is always active.

Re bit 02:
0: Without initial rounding-off
1: With initial rounding-off. The selected ramp-up/down time is correspondingly exceeded. The initial rounding-off is a sensitive way of specifying small changes (progressive reaction when keys are pressed).
The jerk for the initial rounding-off is independent of the ramp-up time and only depends on the selected maximum speed (p1082). It is calculated as follows:

$$r = 0.01 \% * p1082 [1/s] / 0.13^2 [s^2]$$
The jerk acts up until the maximum acceleration is reached ($a_{max} = p1082 [1/s] / p1047 [s]$), and then the drive continues to run linearly with a constant rate of acceleration. The higher the maximum acceleration (the lower that p1047 is), the longer the ramp-up time increases with respect to the set ramp-up time.

Re bit 03:

0: Non-volatile data save deactivated.

1: The setpoint for the motorized potentiometer is saved in a non-volatile fashion (for bit 00 = 1).

1500.000 [rpm]**Description:** Sets the highest possible speed.**Dependency:** Refer to: p0115, p0230, r0313, p0322, r0336**Notice:** After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.**Note:** The parameter applies for both motor directions. The parameter has a limiting effect and is the reference quantity for all ramp-up and ramp-down times (e.g. down ramps, ramp-function generator, motor potentiometer). Since the parameter is part of quick commissioning (p0010 = 1), it is defined appropriately when p0310, p0311, and p0322 are changed.

The following limits are always effective for p1082:

 $p1082 \leq p0322$, if $p0322 > 0$ $p1082 \leq 60 \cdot \text{Minimum} (15 \cdot r0336, 650 \text{ Hz}) / r0313$ $p1082 \leq 60 \cdot \text{Maximum power unit pulse frequency} / (k \cdot r0313)$ $k = 12$ for vector control ($r0108.2 = 1$), $k = 6.5$ for V/f control ($r0108.2 = 0$)If a sine-wave filter ($p0230 = 3$) is parameterized as output filter, then the maximum speed is limited corresponding to the maximum permissible filter output frequency (refer to the filter data sheet). For reactors and dv/dt filters, it is limited to 150 Hz / $r0313$ (for chassis power units) or 120 Hz / $r0313$ (for booksize power units).For the automatic calculation ($p0340 = 1$) the value of the parameter is pre-assigned the maximum motor speed ($p0322$). If $p0322 = 0$, the rated motor speed ($p0311$) is used as default (pre-assignment) value. For induction motors that are not catalog motors ($p0301 = 0$), the synchronous no-load speed is used as default (pre-assignment) value ($p0310 \cdot 60 / r0313$).

For synchronous motors, the following additionally applies:

The maximum speed p1082 is restricted to speeds ($r1084$) where the EMF does not exceed the DC link voltage.The effective assignment of the motor data set parameter (e.g. $p0311$) to the drive data set parameter p1082 when pre-assigning should be taken from p0186.p1082 is also available in the quick commissioning ($p0010 = 1$); this means that when exiting via $p3900 > 0$, the value is not changed.For vector control ($p1300 = 20 \dots 23$) the maximum speed is limited to $60.0 / (8.333 \cdot p0115[0] \cdot r0313)$. This can be identified by a reduction in $r1084$. p1082 is not changed in this process due to the fact that the operating mode p1300 can be changed over.When using sine-wave filters ($p0230 = 3, 4$), the maximum speed $r1084$ is limited to 70% of the resonant frequency of the filter capacitance and the motor leakage inductance.**p1083[0...n] CO: Speed limit in positive direction of rotation / n_limit pos**VECTOR_G130/G15

Description:	The ramp-function generator ramps-up the speed setpoint from standstill (setpoint = 0) up to the maximum speed (p1082) in this time.		
Dependency:	Refer to: p1082		
Note:	The parameter is adapted during the rotating measurement (p1960 > 0). This is the reason that during the rotating measurement, the motor can accelerate faster than was originally parameterized. For V/f control and encoderless vector control (see p1300), ramp-up times of 0 s are not expedient. The setting should be based on the startup times (r0345) of the motor.

	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	0.0	50.0	1.3
Description:	Sets the ramp-function generator tracking. The output value of the ramp-function generator is tracked (corrected) corresponding to the maximum possible drive acceleration. The reference value is the deviation at the speed/velocity controller input that is necessary to ensure that the motor accelerates at the torque/force limit.		
Recommend.:	p1145 = 0.0: This value deactivates the ramp-function generator tracking. p1145 = 0.0 ... 1.0: Generally, these values are not practical. They cause the motor to accelerate below its torque limit. The lower the selected value, the greater the margin between the controller and torque limit when accelerating. p1145 > 1.0: The greater the value, the higher the permissible deviation between the speed setpoint and speed actual value.		

Notice: If ramp-function generator tracking is activated and the ramp time is set too short, this can cause unsteady acceleration.
Remedy:
- switch off ramp-function generator tracking (p1145 = 0).
- increase the ramp-up/ramp-down time (p1120, p1121).

Note: In the V/f mode, ramp-function generator tracking is not active.
For SERVO with V/f operation, the following applies:
The complete ramp-function generator is not active, i.e. ramp-up and ramp-down time = 0.

Description: Sets the operating mode for flying restart.

The flying restart allows the drive converter to be powered up while the motor is still rotating. In so doing, the drive converter output frequency is changed until the actual motor speed/velocity is found. The motor then accelerates up to the setpoint at the ramp-function generator setting.

Value:	0: Flying restart inactive 1: Flying restart always active (start in setpoint direction) 2: FlyRestart active after on, fault, OFF2 (start in setp. dir.) 3: FlyRestart active after fault, OFF2 (start in setp. direction) 4: Flying restart always active (start only in setpoint direction) 5: FlyRestart active after on, fault, OFF2 (start only in setp_dir) 6: FlyRestart active after fault, OFF2 (start only in setp. dir.)
Dependency:	For induction motors, the following applies: A differentiation is made between flying restart for V/f control and for vector control (p1300). Flying restart, V/f control: p1202, p1203, r1204 Flying restart, vector control: p1202, p1203, r1205 For synchronous motors, the following applies: Flying restart is not possible with V/f control or if, in the case of sensorless vector control, a Voltage Sensing Module has not been connected and parameterized. Refer to: p1201 Refer to: F07330, F07331
Notice:	The "flying restart" function must be used in cases where the motor may still be running (e.g. after a brief line supply interruption) or is being driven by the load. The system might otherwise shut down as a result of overcurrent. It does not make sense to use "flying restart" together with the "motor holding brake function" (p1215 > 0) because then the flying restart will always be realized with the motor stationary.
Note:	For p1200 = 1, 4, the following applies: Flying restart is active after faults, OFF1, OFF2, OFF3. For p1200 = 2, 5, the following applies: The "power-on" is the first power-on operation after the drive system has been booted. This is practical for motors with a high-inertia load. For p1200 = 1, 2, 3, the following applies: The search is made in both directions. For p1200 = 4, 5, 6, the following applies: The search is only made in the setpoint direction. For operation with encoder, the following applies: p1200 = 1, 4 as well as p1200 = 2, 5 and p1200 = 3, 6 have the same meaning. For V/f control (p1300 < 20), the following applies: The speed can only be sensed for values above approx. 5 % of the rated motor speed. For lower speeds, it is assumed that the motor is at a standstill. If p1200 is changed while commissioning (p0009, p0010 > 0), then it is possible that the old value will no longer be able to be set. The reason for this is that the dynamic limits of p1200 have been changed by a parameter that was set when the drive was commissioned (e.g. p0300).

Caution:

An unfavorable parameter value can result in the motor behaving in an uncontrollable fashion.

**Note:**

In V/f control mode, the parameter serves as a threshold value for establishing the current at the beginning of the flying restart function. When the threshold value is reached, the prevailing search current is set dependent upon the frequency on the basis of voltage inputs.

Reducing the search current can also improve flying restart performance (if the system moment of inertia is not very high, for example).

Description:

The value influences the rate at which the output frequency is changed during a flying restart. A higher value results in a longer search time.

Caution:

An unfavorable parameter value can result in the motor behaving in an uncontrollable fashion.
For vector control, a value that is too low or too high can cause flying restart to become unstable.

**Note:**

The parameter factory setting is selected so that standard induction motors that are rotating can be found and restarted as quickly as possible (fast flying restart).

With this presetting, if the motor is not found (e.g. for motors that are accelerated as a result of active loads) we recommend that the search rate is reduced (by increasing p1203).

Description: Sets the automatic restart mode (AR).

Value: 0: Inhibit automatic restart
1: Acknowledge all faults without restarting
4: Restart after line supply failure w/o additional start attempts
6: Restart after fault with additional start attempts
14: Restart after line supply failure following man. acknowledgment
16: Restart after fault following manual acknowledgment

Recommend.: For brief line supply failures, the motor shaft may still be rotating when restarting. The "flying restart" function (p1200) might need to be activated to restart while the motor shaft is still rotating.

Dependency: The automatic restart requires an active ON command, e.g. that is available at a digital input.
If, for p1210 > 1, there is no active ON command, then the automatic restart is interrupted.
When using an Operator Panel in the LOCAL mode, then there is no automatic start.
For p1210 = 14, 16, a manual acknowledgement is required for an automatic restart.
Refer to: p0840, p0857, p1267
Refer to: F30003

Danger:

If the automatic restart is activated (p1210 > 1) if there is an ON command (refer to p0840), the drive is powered up as soon as any fault messages that are present can be acknowledged. This also occurs after the line supply returns or the Control Unit boots if the DC link voltage is again present or the feedback of the line supply infeed (refer to p0864) is again available. This automatic power-up sequence can only be interrupted by withdrawing the ON command.

Caution:

A change is only accepted and made in the state "initialization" (r1214.0) and "wait for alarm" (r1214.1). When faults are present, therefore, the parameter cannot be changed.
For p1210 > 1, the motor is automatically started.

Note: When automatic restart mode is activated, the supply voltage must remain connected (e.g. backed up by UPS).
Re p1210 = 1:
Faults that are present are automatically acknowledged. If new faults occur after a successful fault acknowledgment, then these are also automatically acknowledged again. For p1210 = 1, fault F07320 is not generated if the acknowledgment attempt was unsuccessful, for example, because the monitoring time p1213 index 0 was exceeded.
Re p1210 = 4:
An automatic restart is only carried out if fault F30003 occurred at the Motor Module or a high signal is present at binector input p1208[1]. If additional faults are present, then these faults are also acknowledged and when successful, starting continues. If the 24 V Control Unit power supply fails, then this is interpreted as a line supply failure.
Re p1210 = 6:
An automatic restart is carried out if any fault has occurred or there is a high signal at binector input p1208[0].
Re p1210 = 14:
As for p1210 = 4. However, faults that are present must be manually acknowledged.
Re p1210 = 16:
As for p1210 = 6. However, faults that are present must be manually acknowledged.

Description: Sets the start attempts of the automatic restart function for p1210 = 4, 6.

Dependency: Refer to: p1210, r1214
Refer to: F07320

Caution: A change is only accepted and made in the state "initialization" (r1214.0) and "wait for alarm" (r1214.1).

Notice: After fault F07320 occurs, the power-on command must be withdrawn and all of the faults acknowledged so that the automatic restart function is reactivated.

After a complete blackout the start counter always starts with the counter value that applied before the blackout, and decrements this startup attempt by 1. If a further attempt to acknowledge is started by the automatic restart function prior to blackout, e.g. when the CU remains active on blackout longer than the time p1212 / 2, the fault counter will already have been decremented by 1. In this case, the fault counter is thus decreased by the value 2.

Note: A start attempt starts immediately when a fault occurs. The start attempt is considered to be completed if the motor was magnetized (r0056.4 = 1) and an additional delay time of 1 s has expired.
As long as a fault is present, an acknowledge command is generated in the time intervals of p1212 / 2. When successfully acknowledged, the start counter is decremented. If, after this, a fault re-occurs before a restart has been completed, then acknowledgement starts again from the beginning.
Fault F07320 is output if, after several faults occur, the number of parameterized start attempts has been reached. After a successful start attempt, i.e. a fault/error has no longer occurred up to the end of the magnetizing phase, the start counter is again reset to the parameter value after 1 s. If a fault re-occurs - the parameterized number of start attempts is again available.
At least one start attempt is always carried out.
After a line supply failure, acknowledgement is immediate and when the line supply returns, the system is powered up. If, between successfully acknowledging the line fault and the line supply returning, another fault occurs, then its acknowledgement also causes the start counter to be decremented.

The monitoring time starts when the faults are detected. If the automatic acknowledgements are not successful, the monitoring time runs again. If, after the monitoring time has expired, the drive has still not successfully started again (flying restart and magnetizing of the motor must have been completed: r0056.4 = 1), then fault F07320 is output.

The monitoring is deactivated with p1213 = 0. If p1213 is set lower than the sum of p1212, the magnetizing time p0346 and the additional delay time due to the flying restart, then fault F07320 is generated at each restart. If, for p1210 = 1, the time in p1213 is set lower than in p1212, then fault F07320 is also generated at each restart.

The monitoring time must be extended if the faults that occur cannot be immediately and successfully acknowledged (e.g. for faults that are permanently present).

Index 1:

The fault counter (refer to r1214) is only set back to the starting value p1211 if, after successful restart, the time in p1213 index 1 has expired. The delay time is not effective for fault acknowledgement without automatic restart (p1210 = 1). After a power failure (blackout) the delay time only starts after the line supply returns and the Control Unit boots. The fault counter is set to p1211, if F07320 occurred, the power-on command is withdrawn and the fault is acknowledged.

The fault counter is immediately updated if the starting value p1211 or the mode p1210 is changed.

Dependency:	Refer to: p1216, p1217, p1226, p1227, p1228, p1278		
Caution:	For the setting p1215 = 0, if a brake is used, it remains closed. If the motor moves, this will destroy the brake.		
Notice:	If p1215 was set to 1 or if p1215 was set to 3, then when the pulses are suppressed, the brake is closed even if the motor is still rotating. Pulse suppression can either be caused by a 0 signal at p0844, p0845 or p0852 or as a result of a fault with OFF2 response. If this is not desirable (e.g. for a flying restart), then the brake can be kept open using a 1 signal at p0855.		
Note:	If the configuration is set to "no holding brake present" when booting, then the motor holding brake will be automatically identified. If a motor holding brake is detected, the configuration is set to "motor holding brake as for sequence control". If a holding brake integrated in the motor is used, then it is not permissible that p1215 is set to 3. if an external motor holding brake is being used, then p1215 should be set to 3 and r0899.12 should be interconnected as control signal. When the function module "extended brake control" is activated (r0108.14 = 1), r1229.1 should be interconnected as control signal. The parameter can only be set to zero when the pulses are inhibited. The parameterization "no motor holding brake available" and "Safe Brake Control" enabled (p1215 = 0, p9602 = 1, p9802 = 1) is not practical if there is no motor holding brake. The parameterization "motor holding brake the same as sequence control, connection via BICO" and "Safe Brake Control" enabled (p1215 = 3, p9602 = 1, p9802 = 1) is not practical.

The pulses are suppressed when the time expires.		
Recommend.:	This time should be set longer than the actual closing time of the brake. This ensures that the pulses are only suppressed after the brake has closed.		
Dependency:	Refer to: p1215, p1216		
Notice:	If the selected closing time is too short with respect to the actual closing time of the brake, then the load can sag. If the closing time is selected to be too long with respect to the actual closing time of the brake, the control works against the brake and therefore reduces its lifetime.

Description: Sets the monitoring time for the standstill identification.
When braking with OFF1 or OFF3, standstill is identified after this time has expired, after the setpoint speed has fallen below p1226 (also refer to p1145).
After this, the brake control is started, the system waits for the closing time in p1217 and then the pulses are suppressed.

Dependency: Refer to: p1215, p1216, p1217, p1226

Notice: For p1145 > 0.0 (RFG tracking) the setpoint is not equal to zero dependent on the selected value. This can therefore cause the monitoring time in p1227 to be exceeded. In this case, for a driven motor, the pulses are not suppressed.

Note: Standstill (zero speed) is detected if, during the complete monitoring time (p1227), the speed setpoint falls below the speed threshold (p1226).
For p1227 = 300.000 s, the following applies:
The monitoring is deactivated.
For p1227 = 0.000 s, the following applies:
With OFF1 or OFF3 and a ramp-down time = 0, the pulses are immediately suppressed and the motor "coasts" down.

- 0: No function
- 1: External armature short-circuit with contactor feedback signal
- 2: Ext. armature short circuit without contactor feedback signal
- 3: Internal voltage protection
- 4: Internal armature short-circuit / DC brake
- 14: DC brake under starting speed

Dependency: Refer to: p0300, p1230, p1232, p1233, p1234, p1235, p1236, p1237, r1238, r1239, p1345, p1346

Danger: Re p1231 = 1, 2:

- only short-circuit-proof motors may be used, or suitable resistors must be used to short-circuit the motor

Re p1231 = 3:

- when the internal voltage protection is active, after pulse suppression, all of the motor terminals are at half of the DC link voltage (without an internal voltage protection, the motor terminals are at zero potential)!

- it is only permissible to use motors that are short-circuit proof (p0320 < p0323).

- The Motor Module must be able to conduct 180% short-circuit current (r0320) of the motor (r0209).

- the internal voltage protection cannot be interrupted due to a fault response. If an overcurrent condition occurs during the active, internal voltage protection, then this can destroy the Motor Module and/or the motor.

- if the Motor Module does not support the autonomous, internal voltage protection (r0192.10 = 0), in order to ensure safe, reliable functioning when the line supply fails, an external 24 V power supply (UPS) must be used for the components.

- if the Motor Module does support the autonomous, internal voltage protection (r0192.10 = 1), in order to ensure safe, reliable functioning when the line supply fails, the 24 V power supply for the components must be provided through a Control Supply Module.

- if the internal voltage protection is active, it is not permissible that the motor is driven by the load for a longer period of time (e.g. as a result of loads that move the motor or another coupled motor).

Re p1231 = 4 and synchronous motor:

- when armature short-circuit is active, all of the motor terminals are at half of the DC link potential.
- it is only permissible to use motors that are short-circuit proof (p0320 < p0323).
- The Motor Module must be able to conduct 180% short-circuit current (r0320) of the motor (r0209).

Note:

Re p1231 = 1, 2:

The external armature short circuit can only be selected for synchronous motors (p0300). In this case, control bit BO: r1239.0 must be interconnected (e.g. to a digital input) to control the external contactor.

The external armature short circuit cannot be set as a fault response. It can be triggered via binector input p1230. It is also always activated in the case of pulse suppression.

Re p1231 = 3:

Internal voltage protection (using an internal armature short circuit) can only be selected for synchronous motors (p0300) and Motor Modules in booksize or chassis format. Further, it is not permissible for Safety to be active on blocksize Motor Modules (i.e. p9501 = 0 and p9601 = 0). The internal voltage protection prevents the DC link capacitance from being charged if there is no possibility of regenerating the EMF of a motor operated in the field-weakening mode. The Motor Module must support this function (r0192.9 = 1).

a) If the Motor Module does not support the autonomous, internal armature short-circuit (r0192.10 = 0), the armature short-circuit is activated as soon as the activation criterion is fulfilled (refer below):

b) If the Motor Module supports the autonomous internal voltage protection (r0192.10 = 1), then the Motor Module itself decides - using the DC link voltage - as to whether the short-circuit should be activated. In this case, protection is also provided even if the DRIVE-CLiQ connection between the Control Unit and Motor Module was interrupted. The short circuit is activated if the DC link voltage exceeds 800 V. If the DC link voltage falls below 450 V, then the short-circuit is withdrawn. This therefore ensures that the required input voltage for the Control Supply Module is maintained.

Re p1231 = 4:

The function is activated as soon as the activation criterion is fulfilled.

- the function can be initiated by OFF2

a) For synchronous motors (p0300 = 2xx, 4xx), the internal armature short-circuit is initiated.

- the Motor Module must support this function (r0192.9 = 1).

b) For induction motors (p0300 = 1xx), the DC brake is initiated.

Activation criterion (one of the following criteria is fulfilled):

- 1 signal via binector input p1230 (DC brake activation)
- the drive is not in the state "S4: Operation" or in S5x (refer to function diagram 2610).
- the internal pulse enable is missing (r0046.19 = 0).

Re p1231 = 14:

This DC brake can only be set on induction motors.

The DC brake is triggered if a 1 signal is pending at binector input p1230 during operation and the current speed is below the starting speed p1234. Then, following upstream demagnetization (see p0347), the braking current p1232 is injected for the duration of time set in p1233. This is followed by automatic switch-off. During operation the command for DC braking can be withdrawn at any time.

DC braking by means of fault response continues to be possible.

Re p1231 = 3, 4, 14:

The value can only be changed to values not equal to 3 or 4 or 14 if p0491 is not equal to 4 and p2101 is not equal to 6 (armature short-circuit/DC brake not set).

In the case of SERVO, the DC brake does not function in V/f operation (p1317).

Regarding the state "active" (r1238 = 2), "active - feedback signal "Closed" OK" (r1238 = 3)", "active - feedback signal "Closed" missing" (r1238 = 4)":

Dependency: Refer to: p1230, p1231, p1232, p1233, p1234, p1235, p1236, p1237

Note:

External armature short-circuit (bits 0 ... 3):

Re bit 00:

Using this signal, the motor is short-circuited through an external contactor circuit. This means that this BO: p1239.0 must be interconnected e.g. to a digital output.

Re bit 01:

This signal indicates the state of the contactor to establish the armature short-circuit. To do this, BI: p1235 must be interconnected to a digital input.

Re bit 02:

The external armature short-circuit configuration is ready and is activated as soon as the activation criterion is fulfilled.

Re bit 03:

1: A feedback signal from an external contactor was parameterized in BI: p1235.

Internal voltage protection / internal armature short-circuit (bits 4 ... 6):

Re bit 04:

a) Internal voltage protection (p1231 = 3) was selected and the Motor Module does not support the autonomous internal voltage protection (r0192.10 = 0).

The Control Unit issues the command to the Motor Module to short-circuit the motor through the power semiconductors.

a) Internal voltage protection (p1231 = 3) was selected and the Motor Module supports the autonomous internal voltage protection (r0192.10 = 1).

The Motor Module decides autonomously whether the armature short-circuit is activated. In this case, the following applies: r1239.4 = r1239.5.

c) Internal armature short-circuit (p1231 = 4) was selected.

The Control Unit issues the command to the Motor Module to short-circuit the motor through the power semiconductors.

Re bit 05:

The Motor Module signals that the motor is short-circuited in the Motor Module through the power semiconductors.

Re bit 06:

a) Internal voltage protection (p1231 = 3) was selected and the Motor Module does not support the autonomous internal voltage protection (r0192.10 = 0).

The internal voltage protection is ready and is activated as soon as the activation criterion is fulfilled.

a) Internal voltage protection (p1231 = 3) was selected and the Motor Module supports the autonomous internal voltage protection (r0192.10 = 1).

The internal voltage protection is ready and the Motor Module decides autonomously - using the DC link voltage - whether the short-circuit is activated. In this case, protection is also provided even if the DRIVE-CLiQ connection between the Control Unit and Motor Module was interrupted. The short-circuit is activated if the DC link voltage exceeds 800 V. If the DC link voltage falls below 450 V, then the short-circuit is withdrawn.

c) Internal armature short-circuit (p1231 = 4) was selected.

The internal armature short-circuit is ready and is activated as soon as the activation criterion is fulfilled.

Activation criterion (one of the following criteria is fulfilled):

- the signal at BI: p1230 (armature short-circuit activation) is 1.
- the drive is not in the state "S4: Operation" or in S5x (refer to function diagram 2610).
- the internal pulse enable is missing (r0046.19 = 0).

Dependency:	Refer to: p1245 Refer to: A07400, A07401, A07402, F07403, F07404, F07405, F07406		
Notice:	An excessively high value in p1245 can possibly negatively influence the normal operation of the drive.		
Note:	p1240 = 1, 3: When the DC link voltage limit specified for the Motor Module is reached the following applies: - the Vdc_max controller limits the regenerative energy in order that the DC link voltage is kept below the maximum DC link voltage when braking. - the ramp-down times are automatically increased. p1240 = 2, 3: When the switch-in threshold of the Vdc_min controller is reached (p1245), the following applies: - the Vdc_min controller limits the energy taken from the DC link in order to keep the DC link voltage above the minimum DC link voltage when accelerating. - the motor is braked in order to use its kinetic energy to buffer the DC link. p1240 = 4, 5, 6: When the threshold in r1242 or r1246 is reached, the DC link voltage monitoring initiates a fault (F07403 or F07404) with a response and therefore reduces additional negative effects on the DC link voltage.

Description:	Sets the dynamic factor for the DC link voltage controller (Vdc_max controller). 100% means that p1250, p1251, and p1252 (gain, integral time, and rate time) are used corresponding to their basic settings and based on a theoretical controller optimization. If subsequent optimization is required, this can be carried out using the dynamic factor. In this case p1250, p1251, p1252 are weighted with the dynamic factor p1243. If several modules are connected to the DC link, then the dynamic factor must be increased corresponding to the ratio of the additional capacitances to the capacitance of the module involved.		
Note:	The presetting of the dynamic factor is based on the power units connected to DRIVE-CLiQ. It is assumed that the power units connected via DRIVE-CLiQ are also electrically connected to the DC link. If this is not the case, then the dynamic factor must be optimized manually.

Description:	Sets the lower speed threshold for the Vdc_max controller. When this speed threshold is undershot, the Vdc_max control is switched out and the speed is controlled using the ramp-function generator.		
Note:	For fast braking where the ramp-function generator tracking was active, it is possible to prevent the drive rotating in the opposite direction by increasing the speed threshold and setting a final rounding-off time in the ramp-function generator (p1131). This is supported using a dynamic setting of the speed controller.

VECTOR_G130/G15 0 (n/M)	Can be changed: U, T Data type: FloatingPoint32 P-Group: Functions Not for motor type: REL Min 0.00 Max 100.00	Calculated: - Dynamic index: DDS Units group: - Scaling: - Factory setting 1.00	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1
Description:	Sets the proportional gain for the DC-link voltage controller (Vdc_min controller, Vdc_max controller).		
Dependency:	The effective proportional gain is obtained taking into account p1243 (Vdc_max controller dynamic factor).		
Note:	The gain factor is proportional to the capacitance of the DC link. The parameter is preset to a value that is optimally adapted to the capacitance of the individual Motor Module. The capacitances of the other power units, which are connected to the DC link, can be taken into account using the dynamic factor (p1247 or p1243).

Description:	Sets the integral time for the DC-link voltage controller (Vdc_min controller, Vdc_max controller).		
Dependency:	The effective integral time is obtained taking into account p1243 (Vdc_max controller dynamic factor).		

Note: An integral time is normally not required for single axis drives. For multi-axis drives on the other hand, it may be possible to compensate for interference from other axes using the integral time (integral component) . An integral time of 0 (default) deactivates the integral component of the controller.

Description:	Sets the time threshold for the Vdc_min controller (kinetic buffering). If this value is exceeded a fault is output; the required response can be parameterized. Prerequisite: p1256 = 1.		
Dependency:	Refer to: F07406		
Notice:	If a time threshold has been parameterized, the Vdc_max controller should also be activated (p1240 = 3) so that the drive does not shut down with overvoltage when Vdc_min control is exited (due to the time violation) and in the event of fault response OFF3. It is also possible to increase the OFF3 ramp-down time p1135.

Note:	If the bypass function is selected ((p1260 > 0), then when the power unit restarts after POWER OFF, the state of the bypass switch is evaluated. This means that after the ramp-up, it is possible to directly change into the standby mode. This is only possible for p1267 = 0 (bypass using the control signal) and if the control command after the system has been booted is still available (p1266). This function has a higher priority than the automatic restart function (p1210). The "bypass" function can only be switched out again (p1260 = 0) if the bypass is not active or the bypass function has a fault.

Dependency:	The following functions are deactivated in the simulation mode: - motor data identification routine - motor data identification routine, rotating without encoder - pole position identification routine For V/f control and encoderless vector control, flying restart is not carried out (refer to p1200). Refer to: r0192, p1900, p1910, p1960, p1990 Refer to: A07825, F07826		
Notice:	In simulation mode, binector output r0863.1 = 1 is set. This is why you need to check whether other devices are powered up via this signal before activating simulation mode. You might need to disconnect the corresponding BICO interconnection temporarily.		
Note:	Simulation mode is only possible for DC link voltages below 40 V. In order that the closed-loop control can be calculated, the displayed DC link voltage (r0026, r0070) is set to the rated DC link voltage (refer to p0210). Closed-loop current control and motor model are switched out (disabled) - the same is true for the speed controller for encoderless closed-loop speed control. When fault messages occur, the parameter is not automatically reset. This function is not implemented for SINAMICS GM.

Description: Sets the brake control type (with or without diagnostics evaluation).

Example for brake control with diagnostics evaluation.

- brake control in the Motor Modules in booksize format

- Safe Brake Relay for AC Drive

Example for brake control without diagnostics evaluation.

- Brake Relay for AC Drive

Value: 0: Brake control with diagnostics evaluation
1: Brake control without diagnostics evaluation

Note: If the configuration of the motor holding brake (p1215) is set to "no holding brake present" when booting, then an automatic identification of the motor holding brake will be carried out. If a brake control is detected without diagnostics evaluation (e.g. Brake Relay for AC Drive), then the parameter is set to "brake control without diagnostics evaluation".

It is not permissible to parameterize "brake control without diagnostics evaluation" and also enable "safe brake control" (p1278 = 1, p9602 = 1, p9802 = 1).

	Min - [V]	Max - [V]	Factory setting - [V]
Description:	Displays the switch-in level for the Vdc_max controller. If p1294 = 0 (automatic sensing of the switch-in level = off), then the following applies: AC/AC device: $r1282 = 1.15 * \sqrt{2} * V_{\text{mains}} = 1.15 * \sqrt{2} * p0210$ (supply voltage) DC/AC device: $r1282 = 1.15 * V_{\text{dc}} = 1.15 * p0210$ (supply voltage) If p1294 = 1 (automatic sensing of the switch-in level = on), then the following applies: $r1282 = V_{\text{dc_max}} - 50.0 \text{ V}$ ($V_{\text{dc_max}}$: Overvoltage threshold of the power unit)		
Note:	The Vdc_max controller is not switched back off until the DC-link voltage falls below the threshold $0.95 * p1282$ and the controller output is zero.

	P-Group: V/f open-loop control	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0	Max 19	Factory setting 0
Description:	Sets the V/f control mode of the drive.		
Value:	0: V/f control with linear characteristic 1: V/f control with linear characteristic and FCC 2: V/f control with parabolic characteristic 3: V/f control with parameterizable characteristic 4: V/f control with linear characteristic and ECO 5: V/f control for drives requiring a precise freq. (e.g. textiles) 6: V/f control for drives requiring a precise frequency and FCC 7: V/f control for a parabolic characteristic and ECO 19: V/f control with independent voltage setpoint		
Recommend.:	The use of the vector control operating modes is recommended for synchronous motors.		
Dependency:	If you are working with reduced supply voltages (p0212, bit 0 = 1), only V/f control with independent voltage setpoint (p1300 = 19) can be set as the operating mode.		
Notice:	Active slip compensation is required in the V/f control types with Eco mode (p1300 = 4, 7). The scaling of the slip compensation (p1335) should be set so that the slip is completely compensated (generally 100%). The Eco mode is only effective in steady-state operation and when the ramp-function generator is not bypassed. In the case of analog setpoints, if required the tolerance for ramp-up and ramp-down should be actively increased for the ramp-function generator using p1148 in order to reliably signal a steady-state condition.		
Note:	For the open-loop control modes p1300 = 5 and 6, the slip compensation p1335 and the resonance damping p1338 are internally switched out (disabled) in order to be able to precisely set the output frequency. For the open-loop control modes p1300 = 4 and 7 (Eco mode), the efficiency can be optimized by varying the voltage (when the operating point is constant). During operation (the pulses enabled) the open-loop control mode cannot be changed by changing over drive data sets.

	P-Group: V/f open-loop control	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0	Max 23	Factory setting 20
Description:	Sets the open and closed loop control mode of a drive.		
Value:	0: V/f control with linear characteristic 1: V/f control with linear characteristic and FCC 2: V/f control with parabolic characteristic 3: V/f control with parameterizable characteristic 4: V/f control with linear characteristic and ECO 5: V/f control for drives requiring a precise freq. - Recommend.:** The use of the vector control operating modes is recommended for synchronous motors.
- Dependency:** Closed-loop speed or torque control (with encoder) cannot be selected if the encoder type is not entered (p0400).
Closed-loop speed or torque control can be selected if the closed-loop speed/torque control was selected as operating mode (p0108.2).
Only operation with V/f characteristic is possible if the rated motor speed is not entered (p0311).
A reluctance motor can only be operated in a V/f control mode (p1300 < 20).
Sensorless control on separately excited synchronous motors is only possible with a VSM module (see p0150, p0151).
Refer to: r0108, p0108, p0300, p0311, p0400, p1501
- Notice:** Active slip compensation is required in the V/f control types with Eco mode (p1300 = 4, 7). The scaling of the slip compensation (p1335) should be set so that the slip is completely compensated (generally 100%).
The Eco mode is only effective in steady-state operation and when the ramp-function generator is not bypassed. In the case of analog setpoints, if required the tolerance for ramp-up and ramp-down should be actively increased for the ramp-function generator using p1148 in order to reliably signal a steady-state condition.
- Note:** The closed-loop torque control can only be changed over in operation (p1300 = 20, 21) by selecting the closed-loop speed control (p1501). At the changeover, the setting of p1300 does not change. In this case, the actual state is displayed in r1407, bit 2 and bit 3.
For the open-loop control modes p1300 = 5 and 6 (textile sector), slip compensation p1335, resonance damping p1338, and the I_{max} frequency controller are switched off internally so that the output frequency can be set precisely. The I_{max} voltage controller remains active.
For the open-loop control modes p1300 = 4 and 7 (Eco mode), the efficiency can be optimized by varying the voltage (when the operating point is constant).
Separately-excited synchronous motors can only be operated in modes p1300 = 20, 21 and 23 - or for diagnostic purposes in modes p1300 = 0, 3 and 18. For I/f control (p1300 = 18), the current amplitude can be set using p1609. Both for V/f as well as for I/f control only a small load may be applied to the separately-excited synchronous motor because the excitation current is not calculated as a function of the load.
During operation (the pulses enabled) the open-loop/closed-loop control mode cannot be changed by changing over drive data sets.
p1300 is pre-assigned depending on r0108.2 and p0187.

Description: Sets the configuration for V/f control.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	U _{output} starting angle zero	Yes	No	-
	01	Take the sign of the setpoint voltage into account	Yes	No	-

- Note:** Re bit 00:
If the bit is set the device will always start up with setpoint angle zero on pulse enable. This also affects the setpoint angle for DC braking (p1231).
Re bit 01:
If the bit is set, in the case of V/f control with independent voltage setpoint (p1300 = 19) and negative setpoint voltages at the input of p1330, the setpoint angle is rotated through 180 degrees, thereby achieving a negative output voltage. This renders the voltage boost p1310, p1311 ineffective.

	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.0 [%]	Max 250.0 [%]	Factory setting 50.0 [%]
Description:	Defines the voltage boost as a [%] referred to the rated motor current (p0305). The magnitude of the permanent voltage boost is reduced with increasing frequency so that at the rated motor frequency, the rated motor voltage is present. The magnitude of the boost in Volt at a frequency of zero is defined as follows: Voltage boost [V] = 1.732 * p0305 (rated motor current [A]) x r0395 (stator/primary section resistance [ohm]) x p1310 (permanent voltage boost [%]) / 100 % At low output frequencies, there is only a low output voltage in order to maintain the motor flux. However, the output voltage can be too low in order to achieve the following: - magnetize the induction motor. - hold the load. - compensate for losses in the system. This is the reason that the output voltage can be increased using p1310. The voltage boost can be used for both linear as well as square-law V/f characteristics and is calculated as follows: Voltage boost = 1.732 * p0305 (rated motor current) x r0395 (stator/primary section resistance) x p1310 (permanent voltage boost)		
Dependency:	The current limit p0640 limits the boost. For vector control, the permanent voltage boost (p1310) has no effect as the drive converter automatically sets the optimum operating conditions. Refer to: p1300, p1311, p1312, r1315		
Notice:	The voltage boost increases the motor temperature (particularly at zero speed).		
Note:	The voltage boost is only effective for V/f control (p1300). The boost values are combined with one another if the permanent voltage boost (p1310) is used in conjunction with other boost parameters (acceleration boost (p1311), voltage boost for starting (p1312)). However, these parameters are assigned the following priorities: p1310 > p1311, p1312

	Min 0.0 [%]	Max 250.0 [%]	Factory setting 0.0 [%]
Description:	p1311 only results in a voltage boost when accelerating and generates a supplementary torque to accelerate the load. The voltage boost becomes effective for a positive setpoint increase and disappears as soon as the setpoint has been reached. The build-up and withdrawal of the voltage boost are smoothed. The magnitude of the boost in Volt at a frequency of zero is defined as follows: Voltage boost [V] = 1.732 * p0305 (rated motor current [A]) x r0395 (stator/primary section resistance [ohm]) x p1311 (voltage boost when accelerating [%]) / 100 %		
Dependency:	The current limit p0640 limits the boost. Refer to: p1300, p1310, p1312, r1315

	Min 0.0 [%]	Max 600.0 [%]	Factory setting 0.0 [%]
Description:	Sets the setpoint for slip compensation in [%] referred to r0330 (motor rated slip). p1335 = 0.0 %: Slip compensation deactivated. p1335 = 100.0 %: The slip is completely compensated.		
Dependency:	Prerequisite for a precise slip compensation for p1335 = 100 % are the precise motor parameters (p0350 ... p0360). If the parameters are not precisely known, a precise compensation can be achieved by varying p1335. For V/f control types with Eco optimization (4 and 7), the slip compensation must be activated in order to guarantee correct operation.		
Note:	The purpose of slip compensation is to maintain a constant motor speed regardless of the applied load. The fact that the motor speed decreases with increasing load is a typical characteristic of induction motors. For synchronous motors, this effect does not occur and the parameter has no effect in this case. For the open-loop control modes p1300 = 5 and 6 (textile sector), the slip compensation is internally disabled in order to be able to precisely set the output frequency. If p1335 is changed during commissioning (p0009, p0010 > 0), then it is possible that the old value will no longer be able to be set. The reason for this is that the dynamic limits of p1335 have been changed by a parameter that was set when the drive was commissioned (e.g. p0300).

	Min 0.000	Max 0.500	Factory setting 0.000
Description:	Sets the proportional gain of the I_max voltage controller. The I_max controller reduces the drive converter output current if the maximum current (r0067) is exceeded. In the V/f operating modes (p1300) for the I_max control, one controller is used that acts on the output frequency and one controller that acts on the output voltage. The frequency controller reduces the current by decreasing the converter output frequency. The frequency is reduced down to a minimum value (equaling twice rated slip). If the overcurrent condition cannot be successfully resolved using this measure, then the drive converter output voltage is reduced using the I_max voltage controller. Once the overcurrent condition has been resolved, the drive is accelerated along the ramp set in p1120 (ramp-up time).		
Dependency:	In the V/f modes (p1300) for textile applications and for external voltage setpoints, only the I_max voltage controller is used.		
Notice:	When deactivating the I_max controller, the following must be carefully observed: When the maximum current (r0067) is exceeded, the output current is no longer reduced, however, overcurrent alarm messages are generated. The drive is shut down if the overcurrent limit (r0209) is exceeded.		
Note:	The I_max limiting controller becomes ineffective if the ramp-function generator is deactivated with p1122 = 1. p1341 = 0: I_max frequency controller deactivated and I_max voltage controller activated over the complete speed range.

08	Speed limiting controller	With M_limits	With I_limits	6640

Note:

Re bit 00 (not for permanent-magnet synchronous motors):

Initially, the flux is only established with a low rate of rise when magnetizing the induction motor. The flux setpoint p1570 is reached again at the end of the magnetizing time p0346.

Re bit 01 (not for permanent-magnet synchronous motors):

Initially, the flux is only established with a low rate of rise when magnetizing the induction motor. The flux setpoint p1570 is reached again at the end of the magnetizing time p0346. When quick magnetizing (p1401.6 = 1) is selected, soft starting is internally deactivated and alarm A07416 is displayed.

The flux differentiation can be switched out if a significant ripple occurs in the field-generating current setpoint (r0075) when entering the field weakening range. However, this is not suitable for fast acceleration operations because then, the flux decays more slowly and the voltage limiting responds.

Re bit 02 (not for permanent-magnet synchronous motors):

The flux build-up control operates during the magnetizing phase p0346 of the induction motor. If it is switched out, a constant current setpoint is injected and the flux is built up corresponding to the rotor time constant. When quick magnetizing (p1401.6 = 1) is selected and when flux build-up control is de-energized alarm A07416 is displayed.

Re bit 03:

The load-dependent calculation of the flux characteristic is only available for separately-excited synchronous motors.

Re bit 04 (only for vector control with sensor):

The flux controller does not operate in the range of the current model and not in the range of the flux impression (refer to p1750.4).

Re bit 05 (only for vector control with sensor):

Extremely rugged control operation is possible by directly toggling between the current model and flux impression. We therefore recommend that, in addition, the time-controlled model change is switched in (p1750.4 = 1) or the model changeover limits are significantly increased (p1752 > 0.35 * p0311; p1753 = 5 %).

Re bit 06 (not for induction motors):

Magnetizing is performed with maximum current (0.9 * r0067). With active identification of the stator resistance (see p0621) quick magnetizing is internally deactivated and alarm A07416 is displayed. During a flying restart of a rotating motor (see p1200) no quick magnetizing takes place.

Re bit 07:

if the speed of the drive exceeds the effective speed limit of the speed limiting controller, the torque limit is reduced linearly to zero as the deviation becomes greater. This reduces the integral component of the speed controller and, in turn, the overshoot during load shedding (see also F07901 and p2162).

Re bit 08:

The speed limiting controller sets the speed to maximum by opening the torque limits as far as the current limits (bit 08 = 0) or taking the torque limits into account (bit 08 = 1).

Caution:

Speed control with encoder (p1300 = 21):

For the speed or position signal of the motor model there must always be a motor encoder available (evaluation via SMC/SMI; see also p0400). The actual speed of the motor r0061 and the position data for synchronous motors continue to come from this motor encoder and are not affected by the setting of parameter p1440.

Notice:

Speed control without encoder (p1300 = 20):

Dependent upon the transmission path of the external speed signal there will be dead times which have to be taken into account when setting the speed controller parameters (p1470, p1472) and can lead to dynamic losses accordingly. It is for this reason that signal transmission times have to be kept as low as possible.

So that the speed controller can also work at standstill, set p1750 bit 2 = 1 (controlled operation as of zero speed for passive loads). If you do not make this setting, operation will switch to open-loop speed control in the low speed range, switching the closed-loop speed controller off and rendering the measured actual speed ineffective.

Description:	Sets the smoothing time constant (PT1) for the speed actual value.		
Dependency:	Refer to: r0063		
Notice:	Smoothing times above 20 ms are only possible if the drive is accelerated or braked with the appropriately long ramp-up/ramp-down times. Otherwise, significant torque errors can occur and there is the danger that the drive is powered down (tripped) with F07902 (motor stalled).		
Note:	The speed actual value should be smoothed for encoders with a low pulse number or for resolvers. After this parameter has been changed, we recommend that the speed controller is adapted and/or the speed controller settings checked Kp (p1460) and Tn (p1462).

Description:	Sets the signal source for the integrator setting value for the velocity controller. The signal to set this integrator setting value is interconnected via p1477.		
Dependency:	The setting value of the speed controller integrator is weighted with the scaling factor of the signal source in p1479. If p1478 is interconnected to the integral output of the speed controller (r1482), then after the magnetizing time (r0346) and if the speed controller is enabled, the integral component of the controller is set to the last value before the pulse inhibit. This value is set if no setting command (p1477) is interconnected or, at the instant that the pulses were inhibited, a setting command is available, which is not deactivated up to the next time that the pulses are inhibited. For encoderless vector control, in addition p1400.1 should be set to 1 so that when the drive is stopped, the integral component of the speed controller is not controlled down to zero. In order that when setting the integrator output, only the static torque is detected, we recommend that the accelerating torque is completely pre-controlled (e.g. p1496). If p1478 is interconnected to another output other than r1482, then after magnetizing and speed controller enable, the integral output is set once if the setting command is not interconnected (p1477 = 0). Description:	Sets the signal source for the acceleration pre-control.		
Dependency:	The signal source for the acceleration is activated with p1400.2 = 1. For p1400.2 = 0, the acceleration pre-control is calculated from the speed setpoint change from r0062. For p1400.2 = 0 and activate reference model (p1400.3 = 1) the acceleration pre-control is switched out. Refer to: p1400, p1496		
Note:	If the acceleration is entered as external signal, then the accelerating torque is calculated as follows (r1518): $r1518 = \text{acceleration (\% of p2007)} / 100 \% * (p2007 * 60 \text{ s}) / p0311 * r0345 / 1 \text{ s} * r0333$

Description:	Sets the scaling for the acceleration pre-control of the speed/velocity controller.		
Dependency:	When the reference model is activated (p1400.3 = 1) and for an internal acceleration pre-control (p1400.2 = 0), the acceleration pre-control is switched out (disabled). The reference model (p1400.3 = 1) and external acceleration pre-control (p1400.2 = 1) can be operated together. Refer to: p0341, p0342		
Note:	The parameter is set to 100% by the rotating measurement (refer to p1960). The acceleration pre-control may not be used if the speed setpoint manifests significant ripple (e.g. analog setpoint) and the rounding-off in the speed ramp-function generator is disabled. We also recommend that the pre-control mode is not used if there is gearbox backlash.

Description: Sets a dynamic voltage reserve.

Note: In the field weakening range, it must be expected that the control dynamic performance is somewhat restricted due to the limited possibilities of controlling/adjusting the voltage. This can be improved by increasing the voltage margin (reserve). Increasing the reserve reduces the steady-state maximum output voltage (r0071).

Description:	Sets the efficiency optimization. When optimizing the efficiency, the flux setpoint of the closed-loop control is adapted as a function of the load. For p1580 = 100 %, under no-load operating conditions, the flux setpoint is reduced to 50 % of the rated motor flux.		
Note:	It only makes sense to activate this function if the dynamic response requirements of the speed controller are low. If the start of field weakening is shifted to lower speeds, then the voltage reserve is increased for partial load situations. If the start of field weakening is shifted to higher speeds, the voltage reserve is appropriately reduced so that for fast load changes, it can be expected that this will have a negative impact on the dynamic performance.

If the difference lies outside the specified limit value, then the I component of the excitation current flux controller is kept. Instead of this, for the flux controller of the field-generating current, an additional I controller is switched in (integral time according to p1592). If the difference again lies within the bandwidth, the I component of the excitation current flux controller is reactivated and the I component of the flux controller of the field-generating current is reduced as an exponential function with respect to time. The reduction of the I component over time depends on the rotor time constant (r0384).

Description:	Sets the static torque setpoint for encoderless vector control (SLVC). This parameter is entered as a percentage referred to the rated motor torque (r0333). For encoderless vector control, when the motor model is shut down, an absolute current is impressed. p1610 represents the maximum load that occurs at a constant setpoint speed.		
Notice:	p1610 should always be set to at least 10 % higher than the maximum steady-state load that can occur.		

Note: For p1610 = 0%, a current setpoint is calculated that corresponds to the no-load case (ASM: rated magnetizing current).
For p1610 = 100 %, a current setpoint is calculated that corresponds to the rated motor torque.
Negative values are converted into positive setpoints in the case of induction and permanent-magnet synchronous motors.

	P-Group: Closed-loop control	Units group: -	Unit selection: -
	Not for motor type: REL, FEM	Scaling: -	Expert list: 1
	Min -	Max -	Factory setting 0000 bin

Description: Sets the configuration for the motor model.
 Bit 0 = 1: Forces open-loop speed-controlled starting (ASM).
 Bit 1 = 1: Forces the system to pass through frequency zero, open-loop-controlled (ASM).
 Bit 2 = 1: Drive remains in full closed-loop control mode, even at zero frequency (ASM).
 Bit 3 = 1: Motor model evaluates the saturation characteristic (ASM).
 Bit 4 = 1: Time-controlled change between current and observer models (ASM).
 Bit 5 = 1: HF signal injection to estimate the continuous rotor position (PESM).
 Bit 6 = 1: If the motor is blocked, encoderless vector control remains speed-controlled (ASM).

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Controlled start	Yes	No	-
	01	Controlled through 0 Hz	Yes	No	-
	02	Closed-loop ctrl oper. down to zero freq. for passive loads	Yes	No	-
	03	Motor model Lh_pre = f(PsiEst)	Yes	No	-
	04	Model changeover	Time controlled	Freq. controlled	-
	05	Cl.-loop control mode PESM up to f=0 with HF signal injection	Yes	No	-
	06	Closed-loop control when motor is blocked	Yes	No	-

Caution:

Do not use bit 6 = 1 if the motor can be reversed by the load. Long wait times due to blocking (p2177) can cause the motor to stall. In this case you should deactivate the function or use closed-loop control throughout the speed range (note the information re bit 2 = 1).

Note:

Bit 0 ... Bit 2 only have influence for sensorless vector control, bit 4 only for vector control with sensor. Bit 2 is pre-assigned depending on p0500.

Re bit 02 = 1:

The sensorless vector control is effective down to zero frequency. A change is not made into the open-loop speed controlled mode.

This operating mode is possible for passive loads. These include applications where the load itself does not generate any active torque and therefore only acts reactively to the drive torque of the induction motor.

If bit 2 is set to 1, then bit 3 is also automatically activated. Manual deselection is possible and can make sense if, for third-party motors, the saturation characteristic (p1960) was not carried out. Generally, for standard SIEMENS motors, the already pre-assigned (default value) saturation characteristic is adequate.

For bit 2 = 1, the selection of bits 0 and 1 is ignored.

Re bit 02 = 0:

Bit 3 is deactivated automatically.

Re bit 05 = 1:

The selection of HF signal injection is only relevant for permanent-magnet synchronous motors (PESM). Bits 0..4 are not relevant for PESM.

For the purpose of component configuration, an automatic system run-up is triggered on first-time activation. Activation is, therefore, only possible outside of motor commissioning (p0010 = 0).

Re bit 06 = 1:

The following applies for encoderless vector control of induction motors only: If the motor is blocked (see p2175, p2177), the time condition p1758 is bypassed and there is no changeover to open-loop control.

Note: ASM: Induction motor
 PEM: Permanent magnet synchronous motor
 When selecting the compensation of the valve interlocking via Rs (bit 7), the compensation in the gating unit is deactivated and is instead taken into account in the motor model.
 In order that the correction values of the Rs, Lh and kT adaptation (selected using Bit 0 ... Bit 2) are correctly accepted when changing over the drive data set, a dedicated motor number must be entered into p0826 for each different motor.

VECTOR_G130/G15 0	Can be changed: U, T Data type: FloatingPoint32 P-Group: Modulation Not for motor type: - Min 1.000 [kHz]	Calculated: - Dynamic index: DDS Units group: - Scaling: - Max 16.000 [kHz]	Access level: 2 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 4.000 [kHz]
Description:	Sets the drive converter switching frequency. This parameter is preset to the rated converter value when the drive is first commissioned.		
Dependency:	The pulse frequency can, depending on the current controller sampling time (p0115[0]) assume the following values: $p1800 = 1 / (p0115[0] * 2)$ or $p1800 = n / p0115[0]$ where $n = 1, 2, 3, \dots$ Example: $p0115[0] = 250 \mu s \rightarrow p1800 = 2, 4, 8, 12, 16 \text{ kHz}$ Possible setting values can be taken from r0114 (if p0009 = p0010 = 0). If p0092 = 1 the sampling times p0115 and the pulse frequency p1800 are checked every time the parameters are downloaded, and reset to the initial values if necessary. This check can be deactivated by setting p0092 = 0 (making this setting does not affect isochronous PROFIBUS operation). If wobulation is selected (p1810.2), the pulse frequency can only be changed as part of pulse enabling to values with the following ratio: a) $p1800 \leq 1000 / p0115[0]$ for $p1811 > 0 \%$ b) $p1800 \leq 1000 * 2 / p0115[0]$ for $p1811 = 0 \%$ Under pulse inhibit $p1800 > 1000 / p0115[0] \rightarrow p1811 = 0$ $p1800 > 1000 * 2 / p0115[0] \rightarrow p1810.2 = 0$ and $p1811 = 0$ (applicable for all indices) Refer to: r0110, r0111, p0112, p0113, r0114, p0115, p0230, p1817		

Note: The maximum possible pulse frequency is also determined by the power unit being used.
 When the pulse frequency is increased, depending on the particular power unit, the maximum output current can be reduced (derating, refer to r0067).
 If a sine-wave filter is parameterized as output filter (p0230 = 3), then the pulse frequency cannot be changed below the minimum value required for the filter.
 If p1800 is changed while commissioning (p0009, p0010 > 0), then it is possible that the old value will no longer be able to be set. The reason for this is that the dynamic limits of p1800 have been changed by a parameter that was set when the drive was commissioned (e.g. p1082).

------------------	---	--	---

Description: Displays the actual converter switching frequency.

Index: [0] = Actual
 [1] = Minimum value of the modulator

Note: The selected pulse frequency (p1800) may be reduced if the drive converter has an overload condition (p0290).
 The following applies for vector drives (p0107):
 The pulse frequency can also be reduced when changing over the modulator to an optimized pulse pattern. This is used to avoid overcontrol.
 In the case of chassis power units, two-thirds of the setpoint pulse frequency is displayed in the FLB modulation range.

p1802[0...n] Modulator mode / Modulator mode

VECTOR_G130/G150	Can be changed: T Data type: Integer16 P-Group: Modulation Not for motor type: - Min 0	Calculated: CALC_MOD_LIM_REF Dynamic index: DDS Units group: - Scaling: - Max 9	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
------------------	--	--	---

Description: Sets the modulator mode.

Value:

- 0: Automatic changeover SVM/FLB
- 1: Flat top modulation (FLB)
- 2: Space vector modulation (SVM)
- 3: SVM without overcontrol
- 4: SVM/FLB without overcontrol
- 5: SVM with pulse frequency reduction
- 6: SVM/FLB with pulse frequency reduction
- 7: No edge modulation up to 100 Hz
- 8: No edge modulation up to 60 Hz
- 9: Edge modulation

Dependency: If a sine-wave filter is parameterized as output filter (p0230 = 3, 4), or if the power unit firmware is not able to calculate edge modulation (r0192 bit0 = 0), then only space vector modulation without overcontrol can be set as modulation type (p1802 = 3).

p1802 > 6: Wobulation is deactivated, p1810.2 = 0 and p1811 = 0 (valid for all indices)

Refer to: r0192, p0230, p7003

Notice: If the edge modulation is enabled (p1802 > 6), then the current actual value correction should be activated (p1840.0 = 0), if the Motor Module is connected to a controlled (regulated) DC link (Active Infeed).

Note: When modulation modes are enabled that could lead to overmodulation (p1802 = 0, 1, 2, 5, 6), the modulation depth must be limited using p1803 (pre-assignment, p1803 = 98%). The higher the overmodulation, the greater the current ripple and torque ripple.

When changing p1802[x], the values for all of the other existing indices are also changed.

p1802 = 7, 8 should be used if the drive is operated below 100 Hz or 60 Hz, and it is necessary to avoid changing over to edge modulation. Above these output frequencies, the modulation depth remains limited so that there the full output voltage of the edge modulation is not reached.

Dependency:	If bit 2 is set from 1 to 0, p1811 = 0 is set.				
Notice:	Bit 1 = 0 can only be set under a pulse inhibit and for r0192.14 = 1.				
	Bit 2 can only be set to 1 subject to the following prerequisites:				
	- Pulse inhibit				
	- r0192.16 = 1				
	- p1800 < 2 * 1000/p0115[0]				

Note:

Re bit 00 = 0:
Voltage limitation from the minimum of the DC link voltage (lower ripple in the output current, reduced output voltage).

Re bit 00 = 1:
Voltage limitation from averaged DC link voltage (higher output voltage with increased ripple in the output current).
The selection is only valid if the DC link compensation is not performed in the Control Unit (bit 1 = 0).

Re bit 01 = 0:
DC link voltage compensation in the modulator.

Re bit 01 = 1:
DC link voltage compensation in the current control.

Re bit 02 = 0:
A gating unit that does not permit wobulation is used.
Edge modulation is not possible with a parallel connection.

Re bit 02 = 1:
A gating unit that permits wobulation is used.
For a wobulation amplitude equal to zero ($p1811 = 0$), the maximum possible pulse frequency in $p1800 = 2 \cdot 1/\text{current controller clock cycle} (p0115[0])$.
For a wobulation amplitude greater than zero ($p1811 > 0$), the maximum possible pulse frequency in $p1800 = 1/\text{current controller clock cycle} (p0115[0])$.

Re bit 03 = 1:
The component supports current actual value sensing (and the detection of valve close durations) with double clocking and phase shift.
Activation must be supported by the component (r0192.23) and the system has to be restarted in order for it to take effect.

Description:	Sets bit 0 for recording the power unit in the subgroup for the "offset clocking".				
Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Recording in subgroup for offset clocking	Yes	No	-
Dependency:	Refer to: p1818, p1819				
Note:	A change only becomes effective after booting. If any of the following secondary conditions are not fulfilled, then "offset clocking" is deactivated for all power units in the subgroup. This means that all power units of the subgroup are not clocked with offset. Secondary conditions for clocking with an offset: - the PWM frequency (p1800[D]) of all power units in the subgroup must be the same. - the PWM frequency (p1800[D]) must be the same in all drive data sets in the subgroup. - the following must apply for the ratio between the PWM cycle (1/p1800[D]) and the current controller cycle (p0115[0]): The ratio (1/p1800[D]) / (p0115[0]) must be an even integer number (2, 4, 6, ...) for all power units in the subgroup. or The ratio (p0115[0]) / (1/p1800[D]) must be an integer number (1, 2, 3, ...) for all power units in the subgroup.

	Min -1	Max 16	Factory setting -1
Description:	Display for "offset clocking". Depending on the particular case, the value is interpreted differently: 1. Case: The PWM clock cycle (1/p1800[D]) is greater than the current controller clock cycle (p115[0]) and is an integer and even multiple of it (e.g. p0115[0] = 125 µs, p1800[D] = 4 kHz, 2 kHz, 1 kHz). The value displayed refers to the phase shift in the current-controlled cycles to be applied by the power unit. 2. Case: The current controller clock cycle (p0115[0]) is greater than or equal to the PWM clock cycle (1/p1800[D]) and is an integer multiple (e.g. p0115[0] = 125 µs, p1800[D] = 8 kHz, 16 kHz). The displayed value 1 means that the power unit is to apply a phase shift of 180 ° (from the PWM cycle). 3. Case: If neither case 1 nor case 2 applies to at least one power unit, then only 0 can be entered for all of the power units.		
Dependency:	Refer to: r0108, p0108, p0115, p1800, p1818		
Note:	For reasons of compatibility, the parameter is an adjustable parameter. However, it functions solely as a read parameter. This means that factory setting -1 no longer has any significance and is only available for reasons of compatibility.

	Min 0	Max 1	Factory setting 0
Description:	Sets the phase sequence reversal for the motor. If the motor does not rotate in the required direction, then the output phase sequence can be reversed using this parameter. This means that with the same setpoint, the motor direction is reversed without reversing the encoder actual value. When a speed encoder is being used, it may be necessary to also invert the encoder actual value (p0410).		

Value: 0: Off
1: On

Dependency: Refer to: p1821

Note: This setting can only be changed when the pulses are inhibited.
p1821 can be used to reverse the phase sequence and encoder actual value.

	P-Group: Motor	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0	Max 1	Factory setting 0

Description: Setting to change the direction of rotation.
If the parameter is changed, it reverses the direction of rotation of the motor and the encoder actual value without changing the setpoint.

Value: 0: Clockwise
1: Counter-clockwise

Dependency: Refer to: F07434

Notice: An appropriate fault is output for a drive data set changeover where the direction of rotation changes and the pulses are enabled.

Note: For operation with the phase sequence U/V/W, the direction of rotation is defined when viewing the face side of the motor output shaft.
When changing the direction of rotation, the rotating field direction of the current controller is reversed. The speed actual value (e.g. r0063) is also reversed so that the control sense is kept and internally causing the direction of rotation to be reversed with the same setpoint. Further, the position actual values of the actual encoder are reversed (e.g. r0482[0...2]).
For VECTOR, the following applies:
p1820 can be used to reverse the direction of the motor without reversing the encoder actual value.

Description:

Sets the motor data identification routine.

The motor data identification routine is carried out after the next power-on command.

p1910 = 1:

All motor data and the drive converter characteristics are identified and then transferred to the following parameters:

p0350, p0354, p0356, p0357, p0358, p0360, p1825, p1828, p1829, p1830

After this, the control parameter p0340 = 3 is automatically calculated.

Dependency:

"Quick commissioning" must be carried out (p0010 = 1) before executing the motor data identification routine!

In the simulation mode, the parameter cannot be written into. When selecting the motor data identification routine, the drive data set changeover is suppressed.

Refer to: p1272, p1900

Caution:

After the motor data identification (p1910 > 0) has been selected, alarm A07991 is output and a motor data identification routine is carried out as follows at the next power-on command:

- current flows through the motor and a voltage is present at the drive converter output terminals.
- during the identification routine, the motor shaft can rotate through a maximum of half a revolution.
- however, no torque is generated.

Notice: If there is a motor holding brake, it must be open (p1215 = 2).

To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977).

Note: When setting p1910, the following should be observed:

1. "With acceptance" means:

The parameters specified in the description are overwritten with the identified values and therefore have an influence on the controller setting.

2. "Without acceptance" means:

The identified parameters are only displayed in the range r1912 ... r1926. The controller settings remain unchanged.

3. p1910 = 3, 4, 5 can only be selected for induction motors.

	03	Recalculates the speed controller parameters	Yes	No	-
	04	Speed controller optimization (vibration test)	Yes	No	-
	05	q leakage inductance ident. (for current controller adaptation)	Yes	No	-

Dependency: Refer to: F07988

Note: The encoder is only tested if the rotating measurement with encoder is selected (p1960 = 2).

The following parameters are influenced for the individual optimization steps:

Bit 00: None

Bit 01: p0320, p0360, p0362 ... p0369

Bit 02: p0341, p0342

Bit 03: p1400.0, p1458, p1459, p1460, p1462, p1463, p1470, p1472, p1496

Bit 04: Dependent on p1960

Bit 05: p0391, p0392, p0393, p1402.2 only for induction motors

p1960 = 1, 3: p1400.0, p1458, p1459, p1470, p1472, p1496

p1960 = 2, 4: p1458, p1459, p1460, p1461, p1462, p1463, p1496

The identification of the q leakage inductance can only be carried out for unloaded motors or motors with a low load (load approx. 30% below the rated motor torque). Only then is a current controller adaptation (p0391 ... p0393) parameterized if the q-leakage inductance under no-load conditions is at least 30 % higher than the total leakage inductance (p0356, p0358).

	P-Group: Motor identification	Units group: -	Unit selection: -
	Not for motor type: REL	Scaling: -	Expert list: 1
	Min 0	Max 4	Factory setting 0
Description:	Sets the rotating measurement. The rotating measurement is carried out after the next power-on command. The setting possibilities of the parameter depend on the open-loop/closed-loop control mode (p1300). p1300 < 20 (V/f open-loop control): It is not possible to select rotating measurement or speed controller optimization. p1300 = 20, 22 (encoderless operation): Only rotating measurement or speed controller optimization can be selected in the encoderless mode. p1300 = 21, 23 (operation with encoder): Both versions (encoderless and with encoder) of the rotating measurement and speed controller optimization can be selected.		
Value:	0: Inhibited 1: Rotating measurement in encoderless operation 2: Rotating measurement with encoder 3: Speed controller optimization in encoderless operation 4: Speed controller optimization with encoder		
Dependency:	Before the rotating measurement is carried out, the motor data identification routine (p1900, p1910, r3925) should have already been done. In the simulation mode, a value of 1 cannot be written into the parameter. When selecting the rotating measurement, the drive data set changeover is suppressed. Refer to: p1272, p1300, p1900, p1959 Refer to: A07987		
Danger:	For drives with a mechanical system that limits the distance moved, it must be ensured that this is not reached during the rotating measurement. If this is not the case, then it is not permissible that the measurement is carried out.		
			
Notice:	If there is a motor holding brake, it must be open (p1215 = 2).		
Note:	To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977). When the rotating measurement is activated, it is not possible to save the parameters (p0971, p0977). Parameter changes are automatically made for the rotating measurement (e.g. p1120); this is the reason that up to the end of the measurement, and if no faults are present, no manual changes should be made. The ramp-up and ramp-down times (p1120, p1121) are limited, for the rotating measurement, to 900 s. For speed controller optimization with encoder (p1960 = 2, 4), the speed controller for encoderless operation is also pre-assigned (p1470, p1472). Depending on whether the speed controller optimization is carried out with or without encoder, different Kp/Tn adaptations of the speed controller are set (p1464, p1465). If the drive should be controlled with as well as without speed encoder, then we recommend the use of two drive data sets (p0180). These can then be executed with different speed controller adaptations.

Description:	Activates the pole position identification routine to determine the commutation angle and to carry out a plausibility check.		
Value:	0: Pole position identification off 1: Pole position identification for commutation 2: Pole position identification for plausibility check		
Recommend.:	Re p1982 = 1: This is used for synchronous motors with motor encoder without absolute data. The information/data regarding the absolute commutation angle is supplied via a track C/D, Hall sensors, an absolute encoder or from the pole position identification routine. Re p1982 = 2: This is used for synchronous motor with motor encoder with absolute data to check this data. For VECTOR, the following applies: With p1982 = 2, each time the pulses are enabled it is checked whether the absolute position supplied from the encoder does not exceed a deviation of 45 degrees to the identified pole wheel position. With separately-excited synchronous motors (p0300 = 5), pole position identification cannot be selected if an encoder with position data is used (e.g. SSI encoder).

Description:	This function is only required for synchronous motors and can be started when commissioning for the first time or after replacing an encoder. The function acts on the active motor data set. Alarm A07971 is output while the angular commutation offset is being determined. p1990 is automatically set to 0 after the angular commutation offset has been determined. For p1990 = 1 (encoder adjustment with transfer), the following applies: The angular commutation offset is determined and transferred into p0431. For p1990 = 2 (encoder adjustment for checking), the following applies: The angular commutation offset is determined and is not transferred into p0431. For a deviation of more than 6 ° electrical, fault F07413 is output.		
Value:	0: Deactivated 1: Activated with transfer 2: Activated for checking		
Dependency:	In the simulation mode, the parameter cannot be written into. When selecting the encoder adjustment, the changeover of the drive data sets is suppressed. Encoder adjustment is only carried out if the function module for speed/torque control is available (r0108 bit2 = 1). Refer to: p0325, p0329, p0431, p1272, p1900		
Caution:	When the encoder is being adjusted, the motor must be operated without a load - and if a motor holding brake is being used, this must be opened.

Dependency:	Refer to: p2001, p2002, p2003, r2004		
Note:	For the automatic calculation (p0340 = 1, p3900 > 0) an appropriate pre-assignment is only made if the parameter is not inhibited from being overwritten using p0573 = 1. If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor. Example 1: The signal of an analog input (e.g. r4055[0]) is connected to a speed setpoint (e.g. p1070[0]). The actual percentage input value is cyclically converted into the absolute speed setpoint using the reference speed (p2000). Example 2: The setpoint from PROFIBUS (r2050[1]) is connected to a speed setpoint (e.g. p1070[0]). The actual input value is cyclically converted into a percentage value via the pre-specified scaling 4000 hex. This percentage value is converted to the absolute speed setpoint via reference speed (p2000).

Description:	Sets the reference quantity for voltages. All voltages specified as relative value are referred to this reference quantity. This also applies for direct voltage values (= rms value) like the DC-link voltage. The reference quantity in this parameter corresponds to 100% or 4000 hex or 4000 0000 hex.		

Note: For the automatic calculation (p0340 = 1, p3900 > 0) an appropriate pre-assignment is only made if the parameter is not inhibited from being overwritten using p0573 = 1.

If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.

For infeed units, the parameterized device supply voltage (p0210) is pre-assigned as the reference quantity.

Example:

The actual value of the DC link voltage (r0070) is connected to a test socket (e.g. p0771[0]). The actual voltage value is cyclically converted into a percentage of the reference voltage (p2001) and output according to the parameterized scaling.

Notice:	If various DDS are used with different motor data, then the reference quantities remain the same as these are not changed over with the DDS. The resulting conversion factor should be taken into account (e.g. for trace records). Example: p2002 = 100 A Reference quantity 100 A corresponds to 100 % p305[0] = 100 A Rated motor current 100 A for MDS0 in DDS0 --> 100 % corresponds to 100 % of the rated motor current p305[1] = 50 A Rated motor current 50 A for MDS1 in DDS1 --> 100 % corresponds to 200 % of the rated motor current		
Note:	For the automatic calculation (p0340 = 1, p3900 > 0) an appropriate pre-assignment is only made if the parameter is not inhibited from being overwritten using p0573 = 1. If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor. For infeed units, the rated line current, which is obtained from the rated power and parameterized rated line supply voltage (p2002 = r0206 / p0210 / 1.73) is pre-assigned as the reference quantity. Example: The actual value of a phase current (r0069[0]) is connected to a test socket (e.g. p0771[0]). The actual current value is cyclically converted into a percentage of the reference current (p2002) and output according to the parameterized scaling.

Note: For the automatic calculation (p0340 = 1, p3900 > 0) an appropriate pre-assignment is only made if the parameter is not inhibited from being overwritten using p0573 = 1.

If a BICO interconnection is established between different physical quantities, then the particular reference quantities are used as internal conversion factor.

Example:

The actual value of the total torque (r0079j) is connected to a test socket (e.g. p0771[0]). The actual torque is cyclically converted into a percentage of the reference torque (p2003) and output according to the parameterized scaling.

Description:	Sets the interface mode of the PROFIdrive control words and status words. When selecting a telegram via p0922 (p2079), this parameter influences the device-specific assignment of the bits in the control and status words.		
Value:	0: SINAMICS 1: SIMODRIVE 611 universal 2: VIK-NAMUR		
Dependency:	Refer to: p0922, p2079		
Notice:	The parameter may be protected as a result of p0922 or p2079 and cannot be changed.		
Note:	For p0922 (p2079) = 100 ... 199, p2038 is automatically set to 1 and p2038 can no longer be changed. This means that for these telegrams, the "SIMODRIVE 611 universal" interface mode is set and cannot be changed.

Description:	Sets the PROFIBUS Ident Number (PNO-ID). SINAMICS can be operated with various identities on PROFIBUS. This allows the use of a PROFIBUS GSD that is independent of the device (e.g. PROFIdrive VIK-NAMUR with Ident Number 3AA0 hex).			
Value:	0: SINAMICS S/G 1: VIK-NAMUR

Description: Connector input for the sign-of-life of the clock synchronous PROFIBUS/PROFINET master.
The sign-of-life is expected at bits 12 to 15. Bits 0 to 11 are not evaluated.
The sign-of-life signal is normally received in PZD4 (control word 2) from the PROFIBUS/PROFINET master.

Dependency: Refer to: p0925, r2065

	Min 0 [ms]	Max 20000 [ms]	Factory setting 0 [ms]

Description: Sets the additional monitoring time to monitor the process data received via PROFIBUS.
The additional monitoring time enables short bus faults to be compensated.
If no process data is received within this time, an appropriate message is output.

Recommend.: Do not set the additional monitoring time for clock-synchronous operation.

Description: Status display for the PROFIBUS interface.

Value:

- 0: Off
- 1: No connection (search for baud rate)
- 2: Connection OK (baud rate found)
- 3: Cyclic connection with master (data exchange)
- 4: Cyclic data OK

Note: Re r2054 = 3:

In state 3 (the LED flashes green), a cyclic connection has been established to the PROFIBUS master; however, one of the following prerequisites is missing for cyclic operation:

- No setpoints are being received as the PROFIBUS master is in the STOP condition.

Only for clock-cycle synchronous operation, the following applies:

- The drive is not in synchronism as the global control (GC) has an error.

Re r2054 = 4:

In the status 4 (LED green), the cyclic connection to the PROFIBUS master has been established and setpoints are being received. The clock cycle synchronization is OK, the global control (GC) is error-free.

This state does not provide any statement regarding the quality of the clock cycle synchronous sign-of-life characters on the drive objects.

Description: Sets the signal source for the connector-binector converter.
A PZD receive word can be selected as signal source. The signals are available to be serially passed-on (interconnection).

Dependency: Refer to: r2094, r2095

Note: From the signal source set via the connector input, the corresponding lower 16 bits are converted.
p2099[0...1] together with r2094.0...15 and r2095.0...15 forms two connector-binector converters:
Connector input p2099[0] to binector output in r2094.0...15
Connector input p2099[1] to binector output in r2095.0...15

Description:

Selects the faults for which the fault response should be changed

Dependency:

The fault is selected and the required response is set under the same index.

Refer to: p2101

Notice:

For the following cases, it is not possible to re-parameterize the fault response to a fault:

- if there is no existing fault number.
- the message type is not "fault" (F).
- when a fault is present.

Description:

Sets the fault response for the selected fault.

Value:

0: NONE
 1: OFF1
 2: OFF2
 3: OFF3
 4: STOP1 (being developed)
 5: STOP2
 6: IASC/DCBRAKE
 7: ENCODER (p0491)

Dependency:

The fault is selected and the required response is set under the same index.
 Refer to: p2100

Notice:

It is not possible to re-parameterize the response to a specific fault for faults that are already present (queued).

Note:

The fault response can only be changed for faults with the appropriate identification (see the List Manual, chapter "Faults and alarms").

Example:

F12345 and fault response = OFF3 (OFF1, OFF2, NONE)

--> The default fault response OFF3 can be changed to OFF1, OFF2 or NONE.

Re value = 1 (OFF1):

Braking along the ramp-function generator down ramp followed by a pulse inhibit.

Re value = 2 (OFF2):

Internal/external pulse inhibit.

Re value = 3 (OFF3):

Braking along the OFF3 down ramp followed by a pulse inhibit.

Re value = 5 (STOP2):

n_set = 0

Re value = 6 (armature short-circuit, internal/DC brake):
The value can only be set for all motor data sets when p1231 = 3, 4.
a) For synchronous motors (p0300 = 2xx, 4xx), an internal armature short-circuit is executed.
b) For induction motors (p0300 = 1xx), a DC brake is initiated.
Re value = 7 (ENCODER (p0491)):
The fault response set in p0491 is executed if applicable.
Note:
IASC: Internal armature short circuit
DCBRAKE: Direct current brake

Description:	Displays the number of alarms that have occurred.		
Dependency:	Refer to: r2110, r2123, r2124, r2125, r2134, r2145, r2146, r3121, r3123		
Note:	The buffer parameters are cyclically updated in the background (refer to status signal in r2139). Alarm buffer structure (general principle): r2122[0], r2124[0], r2123[0], r2125[0] --> alarm 1 (the oldest) ... r2122[7], r2124[7], r2123[7], r2125[7] --> Alarm 8 (the latest) When the alarm buffer is full, the alarms that have gone are entered into the alarm history: r2122[8], r2124[8], r2123[8], r2125[8] --> Alarm 1 (the latest) ... r2122[63], r2124[63], r2123[63], r2125[63] --> alarm 56 (the oldest)

-------------	--	---	--

Description: Sets the acknowledge mode for selected fault.

Value:

- 1: Acknowledgment only using POWER ON
- 2: Ack IMMEDIATELY after the fault cause has been removed
- 3: Acknowledgement only for PULSE INHIBIT

Dependency: Selects the faults and sets the required acknowledge mode realized under the same index
Refer to: p2126

Notice: It is not possible to re-parameterize the acknowledge mode of a fault in the following cases:

- if there is no existing fault number.
- the message type is not "fault" (F).
- when a fault is present.

Note: The acknowledge mode can only be changed for faults with the appropriate identification.
Example:
F12345 and acknowledge mode = POWER ON (IMMEDIATELY) --> The acknowledge mode can be changed from POWER ON to IMMEDIATELY.

	12	Alarm class bit 1	High	Low	-

Note: Re bit 03, 05, 07:

These bits are set if at least one fault/alarm occurs. Data is entered into the fault/alarm buffer with delay. This is the reason that the fault/alarm buffer should only be read if, after "fault present"/"alarm present" has occurred, a change in the buffer was also detected (r0944, r9744, r2121).

Re bit 06, 08:

These status bits are used for internal diagnostic purposes only.

Re bit 11, 12:

These status bits are used for the classification of internal alarm classes and are intended for diagnostic purposes only on certain automation systems with SINAMICS functionality.

Description: Configuration word for signals and monitoring functions.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Enable alarm A07903	Yes	No	8010
	01	Load monitoring only in the 1st quadrant	Yes	No	8013
	03	n_act > p2155 own hysteresis	Yes	No	8010
	15	Automatic parameterization carried out (p0340 = 1, p3900 > 0)	Yes	No	-

Dependency: Refer to: r2197

Refer to: A07903

Note:

Re bit 00:
Alarm A07903 is output when the bit is set with r2197.7 = 0 (n_set <> n_act).

Re bit 01:
When the bit is set, load monitoring is only carried out in the 1st quadrant as a result of the positive characteristic parameters (p2182 ... p2190).

Re bit 03:
When the bit is set, r2197 bit 1 and bit 2 are determined via separate hystereses.

Re bit 15:
The bit indicates whether the automatic parameterization (p0340 = 1, p3900 > 0) for the parameters of the extended monitoring functions was carried out. If the bit is not set (e.g. when the configuration is activated (p0108.15)), the parameterization is automatically carried out during booting even if r3925.0 is already 1.

	Min 0.00 [rpm]	Max 60000.00 [rpm]	Factory setting 0.00 [rpm]
Description:	Sets the hysteresis speed (bandwidth) for the signal " $n_{act} > n_{max}$ " (BO: r2197.6).		
Dependency:	Refer to: r1084, r1087, r2197		
Notice:	For p0322 = 0, the following applies: $p2162 \leq 0.1 * p0311$ For p0322 > 0, the following applies: $p2162 \leq 1.02 * p0322 - p1082$ If one of the conditions is violated, p2162 is appropriately and automatically reduced when exiting the commissioning mode.		
Note:	For a negative speed limit (r1087) the hysteresis is effective below the limit value and for a positive speed limit (r1084) above the limit value. If significant overshoot occurs in the maximum speed range (e.g. due to load shedding), you are advised to increase the dynamic response of the speed controller (if possible). If this is insufficient, the hysteresis p2162 can only be increased by more than 10% of the rated speed when the maximum speed (p0322) of the motor is sufficiently greater than the speed limit p1082.

	12	Load monitoring signals a fault condition	Yes	No	8013

Note: Re bit 07:
For servo drives, bit 07 is not used and is always inactive.
Re bit 10:
The torque threshold value 1 is set in p2174.
Re bit 12:
If the fault condition is removed, bit 12 is reset to 0. This is also the case even if the alarm message is still present.

	07	Speed deviation model/external in tolerance	Yes	No	8012
	11	Torque utilization < torque threshold value 2	Yes	No	8012

Note:

Re bit 00:
The speed threshold value 3 is set in p2161.

Re bit 01:
The comparison value is set in p2141. We recommend setting the hysteresis (p2142) for canceling the bit to a value lower than that in p2141. Otherwise, the bit will never be reset.

Re bit 11:
The torque threshold value 2 is set in p2194.

Description: Sets the configuration for the motorized potentiometer of the technology controller.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Data save active	Yes	No	-
	02	Initial rounding-off active	Yes	No	-
	03	Non-volatile data save active for p2230.0 = 1	Yes	No	-

Dependency: Refer to: r2231, p2240

Notice: The following prerequisites must be fulfilled in order to be able to save the setpoint in a non-volatile fashion:

- Firmware with V2.3 or higher.
- Control Unit 320 (CU320) with hardware version C or higher (module with NVRAM).

Note:

Re bit 00:

0: The setpoint for the motorized potentiometer is not saved and after ON is entered using p2240.

1: The setpoint for the motorized potentiometer is saved and after ON is entered using r2231. In order to save in a non-volatile fashion, bit 03 should be set to 1.

Re bit 02:

0: Without initial rounding-off

1: With initial rounding-off.

The selected ramp-up/down time is correspondingly exceeded. The initial rounding-off is a sensitive way of specifying small changes (progressive reaction when keys are pressed). The jerk for initial rounding is independent of the ramp-up time and only depends on the selected maximum value (p2237).

It is calculated as follows:

$$r = 0.0001 * \text{MAX}(p2237, |p2238|) [\%] / 0.13^2 [s^2]$$

The jerk is effective until the maximum acceleration is reached ($a_{\text{max}} = p2237 [\%] / p2247 [s]$ or $a_{\text{max}} = p2238 [\%] / p2248 [s]$), after which the drive continues to run linearly with constant acceleration. The higher the maximum acceleration (the lower that p2247 is), the longer the ramp-up time increases with respect to the set ramp-up time.

Re bit 03:

0: Non-volatile data save deactivated.

1: The setpoint for the motorized potentiometer is saved in a non-volatile fashion (for p2230.0 = 1).

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	Ramp-up/down time independent of set-point sign	Yes	No	-
	01	Integrator independent of Kp	Yes	No	-
	02	Output signal without ramp active	Yes	No	-
Dependency:	Refer to: p2257, p2258, p2280, p2285				
Note:	Re bit 00 = 0: The ramp-down time (p2258) switches to the ramp-up time (p2257) when the sign for the output signal r2260 changes. When the sign changes, the output signal is kept at zero for one arithmetic cycle. Re bit 00 = 1: When r2260 exhibits a positive gradient, the ramp-up time (p2257) is active; when it exhibits a negative gradient, the ramp-down time (p2258) is active. The sign for r2260 does not have any effect on the ramp time. Re bit 01 = 0: The integration time of the PID controller is evaluated with the gain factor Kp (p2280) (p2285 = integral time). Re bit 01 = 1: The integration time of the PID controller is independent of the gain factor (p2285 = integration time) if p2280 > 0. Re bit 02 = 0: When the PID controller is deactivated via p2200, the output signal r2294 is reduced to zero via the ramp-down time p2293. Re bit 02 = 1: When the PID controller is deactivated via p2200, the output signal r2294 is set directly to zero.

Description: Sets the operating mode for the hibernation function.

Value:
0: Hibernation inhibited
1: Hibernation active

Dependency: Refer to: p2200

Caution: When this function is active, the motor can start again automatically.

Note: When the hibernation function (p2398 = 1) is activated, its behavior is defined as to whether the technology controller is additionally switched in (closed loop) or switched out (open loop).
p2200 is used to define the technology controller enable and p2251 its operating mode.
p2200 = 0, p2251 = 0, 1:
Hibernation operates without technology controller (open loop)
p2200 = 1, p2251 = 0:
Hibernation operates with technology controller (closed loop)
p2200 = 1, p2251 = 1:
Hibernation operates without technology controller (open loop) as its output is only used as supplementary setpoint and not as main speed setpoint.

Description:	Sets the number of rotations that can be resolved for a rotary absolute encoder with activated position tracking of the load gear.																							
Dependency:	This parameter is only of significance for an absolute encoder (p0404.1 = 1) with activated position tracking of the load gear (p2720.0 = 1).																							
Note:	The resolution that is set must be able to be represented using r2723. For rotary axes/modulo axes, the following applies: This parameter is preset with p0421 and can be changed. For linear axes, the following applies: This parameter is pre-assigned with p0421, expanded by 6 bits for multiturn information (maximum number of overflows) and cannot be changed.																							

p2722[0...n]	Load gear, position tracking tolerance window / Pos track tol		
VECTOR_G130/G150	Can be changed: C2(1, 4)	Calculated: -	Access level: 3

	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.00	Max 4294967300.00	Factory setting 0.00
Description:	Sets a tolerance window for position tracking. After the system is powered up, the difference between the saved position and the actual position is determined, and depending on this, the following is initiated: Difference within the tolerance window --> The position is reproduced as a result of the encoder actual value. Difference outside the tolerance window --> An appropriate message is output.		
Dependency:	Refer to: F07449		
Caution:	Rotation, e.g. through a complete encoder range is not detected.		
			
Note:	The value is entered in integer (complete) encoder pulses. For p2720.0 = 1, the value is automatically pre-assigned quarter of the encoder range. Example: Quarter of the encoder range = (p0408 * p0421) / 4 It is possible that the tolerance window may not be able to be precisely set due to the data type (floating point number with 23 bit mantissa).

Description:	Displays the position difference before the load gear between powering down and powering up.		
Note:	The increments are displayed in the same format as for r0483/r2723. If the measuring gear of the motor encoder is not activated, the position difference should be read in encoder increments. If the measuring gear of the motor encoder is activated, the position difference is converted using the measuring gear factor.

Description:	Sets the threshold value of the phase synchronism for the line-drive synchronization. A prerequisite for synchronism is achieved if the phase difference is lower than the threshold value.		
Note:	Synchronism is reached (r3819.2 = 1), if the AND logic operation of the results from the phase measurement (p3813) and voltage measurement (p3815) is fulfilled.

VECTOR_G130/G15 0	Can be changed: T Data type: Integer16 P-Group: Functions Not for motor type: REL Min 0 Description: Setting for the friction characteristic record. After the next power-on command, the friction characteristic is automatically recorded. Value: 0: Friction characteristic record deactivated 1: Friction char record activated for all directions 2: Friction char record activated for positive direction 3: Friction char record activated for negative direction Dependency: When selecting the friction characteristic measurement, the drive data set changeover is suppressed. For linear drives (refer to r0108 bit 12) it is not permissible to carry out the friction characteristic measurement for mechanical systems that limit travel. Danger: For drives with a mechanical system that limit the distance moved, it must be ensured that during recording, the friction characteristic is not reached. If this is not the case, then it is not permissible that the measurement is carried out. Notice: To permanently accept the determined settings they must be saved in a non-volatile fashion (p0971, p0977). Note: When the friction characteristic record is active, it is not possible to save the parameters (p0971, p0977). When the friction characteristic record is active (p3845 > 0), it is not possible to change p3820 ... p3829, p3830 ... p3839 and p3842. When recording the friction characteristic, in addition to the friction, the motor losses are also determined (e.g. iron losses, eddy current losses and remagnetizing losses). A differentiation is not made between these individual loss components. We recommend that a motor temperature sensor is used because torque deviations can also be emulated/mapped on the characteristic due to the thermal influence. Description:	Exits quick commissioning (p0010 = 1) with automatic calculation of all parameters of all existing drive data sets that depend on the entries made during quick commissioning. p3900 = 1 initially includes a parameter reset (factory setting, the same as p0970 = 1) for all parameters of the drive object; however, without overwriting the entries made during the quick commissioning. The interconnections of PROFIBUS PZD telegram selection (p0922) and the interconnections via p0700, p1000 and p1500 are re-established and all of the dependent motor, open-loop and control-loop control parameters are calculated (corresponding to p0340 = 1). p3900 = 2 includes the restoration of the interconnections of PROFIBUS PZD telegram selection (p0922) and the interconnections via p0700, p1000 and p1500 and the calculations corresponding to p0340 = 1. p3900 = 3 only includes the calculations associated with the motor, open-loop and closed-loop control parameters corresponding to p0340 = 1.		
Value:	0: No quick parameterization 1: Quick parameterization after parameter reset 2: Quick parameterization (only) for BICO and motor parameters 3: Quick parameterization for motor parameters (only)		
Notice:	After the value has been modified, no further parameter modifications can be made and the status is shown in r3996. Modifications can be made again when r3996 = 0.		
Note:	When the calculations have been completed, p3900 and p0010 are automatically reset to a value of 0. When calculating motor, open-loop and closed-loop control parameters (such as for p0340 = 1) parameters associated with a selected Siemens catalog motor are not overwritten. If a catalog motor has not been selected (see p0300), then the following parameters are reset with p3900 > 0 in order to restore the situation that applied when commissioning the drive for the first time: for induction motors p0320, p0352, p0353, p0362 ... p0369, p0391 ... p0393, p0604, p0605, p0626 ... p0628. for synchronous motors p0326, p0327, p0352, p0353, p0391 ... p0393, p0604, p0605.

	P-Group: Commands	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.00 [µs]	Max 5000.00 [µs]	Factory setting [0] 4000.00 [µs] [1] 4000.00 [µs] [2] 4000.00 [µs]

Description: Sets the sampling time for the inputs and outputs of the Terminal Board 30 (TB30).

Index:
[0] = Digital inputs/outputs (DI/DO)
[1] = Analog inputs (AI)
[2] = Analog outputs (AO)

Dependency: The parameter can only be modified for p0009 = 3, 29.
The sampling times can only be set as an integer multiple of the basic sampling time (r0110, r0111).
Refer to: p0009, r0110, r0111

Note: The modified sampling time is not effective until the drive unit is powered up again.
For clock cycle synchronous PROFIBUS operation, the TB30 hardware (e.g. A/D converter) is operated with the PROFIBUS clock cycle (r2064[1]). This clock cycle is also kept after the PROFIBUS connection has been exited up to the next time that the Control Unit is powered down. In this case, a faster sampling time than the PROFIBUS clock cycle is not practical in p4099[0...2].

p4099[0...2] TM31 inputs/outputs, sampling time / TM31 I/O t_sample

	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.00 [µs]	Max 5000.00 [µs]	Factory setting 4000.00 [µs]

Description: Sets the sampling time for the inputs and outputs of Terminal Module 31 (TM31).

Index:
[0] = Digital inputs/outputs (DI/DO)
[1] = Analog inputs (AI)
[2] = Analog outputs (AO)

Dependency: The parameter can only be modified for p0009 = 3, 29.
The sampling times can only be set as an integer multiple of the basic sampling time (r0110, r0111).
Refer to: p0009, r0110, r0111

Notice: The sampling times entered in index 0 (digital inputs/outputs) and index 2 (analog outputs) must always be greater than or equal to the sampling time in index 1 (analog inputs).

Note:
- the modified sampling time is not effective until the drive unit is powered up again.
- parameter p4099[0] must never equal zero.

	P-Group: -	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0	Max 2	Factory setting 0

Description: Sets the temperature evaluation of Terminal Module 31 (TM31).
This means that the temperature sensor type is selected and the evaluation is switched in.

Value: 0: Evaluation disabled
1: PTC thermistor
2: KTY84

Note: The temperature sensor is connected at terminals X522.7(+) and X522.8(-).

r4101 TM31 temperature evaluation, sensor resistance / TM31 temp R_sensor

	P-Group: Terminals	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: PERCENT	Expert list: 1
	Min - [Ohm]	Max - [Ohm]	Factory setting - [Ohm]

Description: Displays the actual resistance value of the temperature sensor connected at Terminal Module 31 (TM31).

Note: The maximum measurable resistance value is approx. 1700 Ohm.
The temperature sensor is connected at terminals X522.7(+) and X522.8(-).

p4102[0...1] TM31 temperature evaluation fault/alarm threshold / TM31 temp thresh

TM31	Can be changed: T	Calculated: -	Access level: 1
	Data type: Integer16	Dynamic index: -	Func. diagram: 9576
	P-Group: -	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min -48 [°C]	Max 251 [°C]	Factory setting [0] 100 [°C] [1] 120 [°C]

Description: Sets the fault/alarm threshold for the temperature evaluation of Terminal Module 31 (TM31).
Temperature actual value > p4102[0] --> alarm A35211 is output.
Alarm A35211 remains present until the temperature actual value (r4105) falls below the corresponding value (p4102[0] hysteresis).
Temperature actual value > p4102[1] --> fault F35207 is output.
Fault F35207 remains present until the temperature actual value (r4105) falls below the corresponding value (p4102[1] hysteresis) and the fault has been acknowledged.
The hysteresis value is 5 °C and cannot be changed by the user.

Index: [0] = Alarm threshold
[1] = Fault threshold

Dependency: Refer to: r4104

Warning: Fault F35207 only causes the drive to be shut down if there is at least one BICO interconnection between the drive and TM31.

Note: A value > 250 °C deactivates the alarm or fault.
The temperature sensor is connected at terminals X522.7(+) and X522.8(-).

p4103 TM31 temperature evaluation timer / TM31 temp t_timer

TM31	Can be changed: U, T	Calculated: -	Access level: 1
	Data type: FloatingPoint32	Dynamic index: -	Func. diagram: 9576
	P-Group: Motor	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.000 [ms]	Max 600.000 [ms]	Factory setting 0.000 [ms]

Description: Timer for the fault output of the temperature evaluation of Terminal Module 31 (TM31).
This timer is started when the temperature alarm threshold (p4102[0]) is exceeded.
If the timer expires before the temperature in the meantime falls below the alarm threshold, the fault F35207 is output.
If the temperature fault threshold (p4102[1]) is prematurely exceeded before the timer has expired, then fault F35207 is immediately output.
As long as the temperature of the TM31 has still not exceeded the fault threshold and the alarm threshold has again been undershot, the fault can be acknowledged.

Dependency: Refer to: r4104

Warning: Fault F35207 only causes the drive to be shut down if there is at least one BICO interconnection between the drive and TM31.

Note: With p4103 = 0 ms, the timer is deactivated and only the fault threshold is effective.

	P-Group: Terminals	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: TEMP	Expert list: 1
	Min - [°C]	Max - [°C]	Factory setting - [°C]

Description: Displays the actual temperature value of the temperature evaluation of Terminal Module 31 (TM31).

Dependency: For sensor type PTC (p4100 = 1), the following applies:
- below the nominal response temperature, r4105 = -50 °C.
- above the nominal response temperature, r4105 = 250 °C.
For sensor type KTY84-130 (p4100 = 2), the following applies:
- the displayed value corresponds to the temperature actual value.
Refer to: p4100

Note: For an invalid temperature actual value, (e.g. a short-circuit at the sensor input), r4105 = -300 °C is displayed.
The temperature sensor is connected at terminals X522.7(+) and X522.8(-).

Description:	Sets the permissible tolerance in encoder pulses for the zero mark distance in the context of zero mark monitoring. Causes fault F3x100 to appear less frequently.		
Dependency:	Refer to: p0430 Refer to: F31100		
Note:	The parameter is activated using p0430.21 = 1 (zero mark tolerance).		
p4681[0...n]	Zero mark monitoring, tolerance window limit 1 positive / ZM tol lim 1 pos		
ENCODER, VECTOR_G130/G15 0	Can be changed: C2(4) Data type: Unsigned32 P-Group: Encoder Not for motor type: - Min 0	Calculated: - Dynamic index: EDS, p0140 Units group: - Scaling: - Max 1000	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 2
Description:	Sets the positive tolerance window in encoder pulses for limit 1 for the zero mark monitoring. If the deviation is less than this limit, the PPR is not corrected. If it is higher than this limit, fault F3x131 is triggered. If fault F3x131 is re-parameterized to alarm (A) or no message (N), the encoder pulses which have not been corrected are added to the accumulator (r4688). The accumulator can be deactivated using p0437.7.		
Dependency:	Refer to: p0437, p4688 Refer to: F31131		
Note:	This monitoring is activated by setting p0437.2 = 1 (position actual value correction). The positive limit describes additional pulses due to EMC.

Description:	Sets the negative tolerance window in encoder pulses for limit 1 for the zero mark monitoring. If the deviation is less than this limit, the PPR is not corrected. If it is higher than this limit, fault F3x131 is triggered. If fault F3x131 is re-parameterized to alarm (A) or no message (N), the encoder pulses which have not been corrected are added to the accumulator (r4688). The accumulator can be deactivated using p0437.7.		
Dependency:	Refer to: p0437, p4681, p4688 Refer to: F31131		
Note:	This monitoring is activated by setting p0437.2 = 1 (position actual value correction). For a set value = -1001, the negated value of p4681 is effective. The negative limit describes the pulses lost due to a covered glass panel in the incremental encoder.

Description:		Displays the trace buffer (record buffer) for trace 0 and signal 0. The trace (record) buffer is sub-divided into memory banks, each containing 16384 values. Parameter p4795 can be used to toggle between the individual banks. Example A: The first 16384 values of signal 0, trace 0 are to be read out. In this case, memory bank 0 is set with p4795 = 0. The first 16384 values can now be read out using r4740[0] to r4740[16383]. Example B: The values 16385 to 32768 from signal 0, trace 0 are to be read out. In this case, memory bank 1 is set with p4795 = 1. The values can now be read out in r4740[0] to r4740[16383].

Description:	Specifies the winding system for a parallel circuit configuration. The following limitations/restrictions are obtained depending on the setting: One winding system (p7003 = 0): - the motor data identification routine (p1910) determines the stator resistance and the cable resistance. The cable resistance of an individual Motor Module is entered into p0352. - the current symmetrizing is activated as standard after the motor data identification routine (p7035 = 1). - individual Motor Modules can be activated and deactivated (p7001). - the edge modulation is not possible (p1802). Several separate winding systems or motors (p7003 = 1): - the motor data identification routine (p1910) determines the total (overall) resistance. The cable resistance is not measured, but instead, entered as a component of the total resistance (refer to p0352). - all Motor Modules are activated. It is not possible to deactivate a motor model. - the edge modulation can be activated (p1802).		
Value:	0: One winding system 1: Several separate winding systems or motors		
Dependency:	Refer to: p1802

Description:	Sets the action to be executed for NVRAM data. At the end of the action the value is automatically set to 0.		
Value:	0: Inactive 1: Load NVRAM data to parameters 2: Load parameters to NVRAM 3: Reset		
Notice:	After action p7770 = 1 no more pulses may be enabled. After action p7770 = 2, it is essential that parameters are backed up (p0977 = 1) and that a warm restart is then performed (p0009 = 30, p0976 = 2, 3). This will apply the values written.		
Note:	Re value = 1: This action loads the NVRAM data to the parameters. Re value = 2: This action loads the parameters to the NVRAM. Re value = 3: This action sets parameters p7771 ... p7774 to the factory setting. It is recommended to avoid placing unnecessary load on the subsequent upload/download operation.

Description:	Sets the behavior for the automatic firmware update of the DRIVE-CLiQ components.		
Value:	0: Deactivated 1: Upgrade and downgrade 2: Upgrade		
Notice:	If this parameter is changed, it only becomes effective the next time that the drive system boots.		
Note:	The firmware is automatically updated when the system boots. The boot can take several minutes. After the update has been completed, it is necessary to carry out a new POWER ON (power-down/power-up) for the components involved. The firmware update procedure is displayed as follows: Control Unit (LED RDY): Flashes yellow with 0.5 Hz --> firmware is being updated. Flashing yellow with 2 Hz --> POWER ON is required for the components involved. Components involved: Flashing red/green with 0.5 Hz --> firmware is being updated. Flashing red/green with 2 Hz --> POWER ON of the components is required. Only components from firmware version 2.5 support the red/green flashing at 2 Hz.

CU_G_G130, CU_G_G150	Can be changed: U, T Data type: Integer16 P-Group: - Not for motor type: - Min -32786	Calculated: - Dynamic index: - Units group: - Scaling: - Max 32767	Access level: 4 Func. diagram: - Unit selection: - Expert list: 0 Factory setting 0
Description:	Sets the global and unique component number in a drive system with several Control Units. Each index of the parameter corresponds to a possible local component number on the corresponding Control Unit. The indices are allocated to the global component numbers as follows: p7859[0]: Not used p7859[1]: Sets the global component number for the local component number 1 p7859[2]: Sets the global component number for the local component number 2 ... p7859[199]: Sets the global component number for the local component number 199		
Notice:	This parameter is preferably set via suitable commissioning software (e.g. UpdateAgent, STARTER, SCOUT). Changing the parameter via the AOP (Advanced Operator Panel) or BOP (Basic Operator Panel) can destroy a valid unique setting.		
Note:	The parameter is not influenced by setting the factory setting.

Description: Reference to the drive objects whose status has changed.

Index 0:
When changing one of the following indices, then the value in this index is increased.

Index 1...n:
The drive object with object number in p0101[n-1] has changed its status.

Example:
r7868[3] was incremented since the last time it was read.
--> the status of the drive object with object number in p0101[2] was changed.

Description:	Sets the priority for processing the existing drive objects in the system. The parameter enables a free sequence to be set for processing the drive objects. For this purpose all the drive object numbers existing in the system have to be written in the desired sequence into the corresponding indices of the parameter. After re-booting this sequence will be effective without a plausibility check. With the factory setting the following priorities regarding processing are applicable: - The drive objects are pre-sorted according to their type as follows: CONTROL UNIT, INFEED, SERVO, VECTOR, TM, HUB, CU-LINK - If they are of the same type, they are sorted in ascending order according to their drive object number, i.e. the lower the number, the higher the priority for processing.		
Index:	[0] = Drive object number Control Unit [1] = Drive object number object 1 [2] = Drive object number object 2 [3] = Drive object number object 3 [4] = Drive object number object 4 [5] = Drive object number object 5 [6] = Drive object number object 6 [7] = Drive object number object 7 [8] = Drive object number object 8 [9] = Drive object number object 9 [10] = Drive object number object 10 [11] = Drive object number object 11 [12] = Drive object number object 12 [13] = Drive object number object 13 [14] = Drive object number object 14 [15] = Drive object number object 15 [16] = Drive object number object 16

 [22] = Drive object number object 22
 [23] = Drive object number object 23

Notice: This parameter may only be used by qualified service personnel.

Note: If the same drive object numbers are used and if the existing drive object numbers in the system are entered incompletely, the content of this parameter is ignored entirely. The behavior as with factory setting will then become effective.

p8620	CAN Node-ID / Node ID		
CU_G_G130 (CAN), CU_G_G150 (CAN)	Can be changed: T	Calculated: -	Access level: 2
	Data type: Unsigned8	Dynamic index: -	Func. diagram: -
	P-Group: -	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 1	Max 126	Factory setting 126
Description:	Display or setting of the CANopen Node ID. The Node ID can be set as follows: 1) Using the address switch on the Control Unit. --> p8620 can then only be read and displays the selected Node ID. --> A change only becomes effective after a POWER ON. --> CANopen Node ID and PROFIBUS address are identical. 2) Using p8620 --> only if all of the DIP switches - from S1 to S7 - are either set to ON or OFF. --> the Node ID is set as standard to 126. --> A change only becomes effective after save and POWER ON.		
Note:	Every node ID change only becomes effective after a POWER ON. The parameter is not influenced by setting the factory setting. It is only possible to independently set CANopen node ID and the PROFIBUS address using p0918 and p8620 (pre-requisite: For DIP switches, all of the switches from S1 to S7 are either set to ON or OFF).

Description:	Sets the bit timing for the C_CAN controller to the associated and selected baud rate (p8622). Bits are distributed to the following parameters of the C_CAN controller in p8623[0...7]: Bit 0 ... 5: BRP (Baud Rate Prescaler) Bit 6 ... 7: SJW (Synchronization Jump Width) Bit 8 ... 11: TSEG1 (Time Segment 1, before the sampling point) Bit 12 ... 14: TSEG2 (Time Segment 2, after the sampling point) Bit 15: Reserved Bit 16 ... 19: BRPE (Baud Rate Prescaler Extension) Bit 20 ... 31: Reserved Example: Baud rate = 20 kbit/s --> p8622 = 6 --> associated bit timing is in p8623[6] --> 0001 2FB6		
Recommend.:	Use the factory setting when setting the bit timing.		
Index:	[0] = 1 Mbit/s [1] = 800 kbit/s [2] = 500 kbit/s [3] = 250 kbit/s [4] = 125 kbit/s [5] = 50 kbit/s [6] = 20 kbit/s [7] = 10 kbit/s		
Dependency:	Refer to: p8622		
Note:	The parameter is not influenced by setting the factory setting.

 When the ramp-function generator is activated, the interconnection from CI: p2151 = r1119 can be changed, so that to evaluate bit 10, the setpoint can be retrieved (taken) from in front of the ramp-function generator.
 Re bit 10, 12:
 When braking, the two bits must indicate the same state. This is the reason that the following parameters must be set the same:
 p2161 (speed threshold value 3, for r2199.0) = p2163 (speed threshold value 4, for r2197.7)
 p2150 (hysteresis speed 3, for r2199.0) = p2164 (hysteresis speed 4, for r2197.7)

Description:	Sets the automatic BICO interconnection of the CANopen control word.		
Value:	0: No interconn 1: Interconnection		
Dependency:	Refer to: r2050, r2090, r2091, r2092, r2093, r8750, r8795, r8850, r8890, r8891, r8892, r8893		

Note: The following BICO interconnections are automatically established if the CANopen control word is mapped at one of the locations x = 0 ... 3 in the receive process data buffer.
 For SINAMICS S120 with CBC10, the PZD interface IF2 is used:
 BI: p0840.0 = r889x.0
 BI: p0844.0 = r889x.1
 BI: p0848.0 = r889x.2
 BI: p0852.0 = r889x.3
 BI: p2103.0 = r889x.7
 For SINAMICS S110, the PZD interface IF1 is used:
 BI: p0840.0 = r209x.0
 BI: p0844.0 = r209x.1
 BI: p0848.0 = r209x.2
 BI: p0852.0 = r209x.3
 BI: p2103.0 = r209x.7
 The write access is rejected if a CANopen control word is not mapped at one of these locations.
 This also causes the project download of the commissioning software to be canceled.

	Min 0.0000 [μs]	Max 25000.0000 [μs]	Factory setting 0.0000 [μs]
Description:	Sets the clock cycle time of the actual value sensing for safe motion monitoring. The slower clock cycle time reduces the maximum permissible velocity - however, it ensures a lower load of the Control Unit for the safe actual value sensing. The maximum permissible velocity, which when exceeded can mean that errors occur during safe actual value sensing, is displayed in r9730. Setting criteria if the motion monitoring functions are executed without an encoder: - The actual value sensing clock cycle must be set to the same value as the current controller clock cycle (p115).		
Dependency:	Refer to: p0115, p9300, p9511 Refer to: F01652		
Notice:	This parameter is overwritten by the copy function of the safety functions integrated in the drive.		
Note:	The parameter is only active for drive-based motion monitoring functions (p9801.2 = 1). The monitoring clock cycle from p9300 must be an integer multiple of this parameter. In the case of motion monitoring functions with encoder, the clock cycle time for actual value sensing must be an integer multiple of the current controller clock cycle and at least 4 times slower than the current controller clock cycle. A factor of at least 8 is recommended. A change only becomes effective after a POWER ON.

Description: Setting for the clock-cycle synchronous PROFIBUS master.
The parameter must be set if the safety-relevant motion monitoring functions integrated in the drive are enabled and there is a clock-cycle synchronous PROFIBUS master.
This is, for example, the case when using the following controls:
- clock-cycle synchronous control for the motion control (e.g. SIMOTION).
- clock-cycle synchronous PROFIsafe master (e.g. SIMATIC S7-400F).

Value:
0: No clock-cycle synchronous PROFIBUS master
1: Clock-cycle synchronous PROFIBUS master present

Dependency: Refer to: C01711, A01796

Notice: As of firmware V2.6, the parameter has no effect.

	P-Group: Safety Integrated	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0.0000 [ms]	Max 25.0000 [ms]	Factory setting 0.0000 [ms]

Description: Sets the clock cycle time of the actual value sensing for safe motion monitoring.
Setting criteria if the motion monitoring functions are executed with an encoder.
- A slower clock cycle time reduces the maximum permissible velocity - however, it ensures a lower load of the Control Unit for safe actual value sensing.
- The maximum permissible velocity which, when exceeded, can mean that errors occur during safe actual value sensing, is displayed in r9730.
- The isochronous PROFIBUS clock cycle is used as a clock cycle time for actual value sensing with a setting of 0 ms; the setting is 1 ms if isochronous operation is not being used.
Setting criteria if the motion monitoring functions are executed without an encoder:
- The actual value sensing clock cycle must be set to the same value as the current controller clock cycle (p115).

Dependency: Refer to: p0115
Refer to: F01652

Note: The parameter is only active for drive-based motion monitoring functions (p9601.2 = 1).
The monitoring clock cycle from p9500 must be an integer multiple of this parameter.
In the case of motion monitoring functions with encoder, the clock cycle time for actual value sensing must be an integer multiple of the current controller clock cycle and at least 4 times slower than the current controller clock cycle. A factor of at least 8 is recommended.
The clock cycle time of the actual value sensing should not be set to more than 8 ms.
A change only becomes effective after a POWER ON.

Description: Assigns the individual cams to the maximum of 4 cam tracks and defines the numerical value for the SGA "cam range".

p9538[0...29] = CBA dec

C = Assignment of the cam to the cam track.

Valid values are 1, 2, 3, 4.

BA = Numerical value for the SGA "cam range".

If the position lies in the range of this cam, the value BA is signaled to the safety-relevant logic via the SGA "cam range" of the cam track set using C.

Valid values are 0 ... 14. Each numerical value may only be used once for each cam track.

Examples:

p9538[0] = 207

Cam 1 (index 0) is assigned cam track 2. If the position lies within the range of this cam, a value of 7 is entered in the SGA "cam range" of the second cam track.

p9538[5] = 100

Cam 6 (index 5) is assigned cam track 1. If the position lies within the range of this cam, a value of 0 is entered in the SGA "cam range" of the first cam track.

Dependency:	Refer to: p9802		
Note:	The "Safe Brake Control" function is not activated until at least one safety monitoring function has been enabled (i.e. p9501 not equal to 0 and/or p9601 not equal to 0). It does not make sense to parameterize "no motor holding brake available" and enable "Safe Brake Control" (p1215 = 0, p9602 = p9802 = 1) if there is no motor holding brake. The parameterization "motor holding brake the same as sequence control, connection via BICO" and "Safe Brake Control" enabled (p1215 = 3, p9602 = 1, p9802 = 1) is not practical. It is not permissible to parameterize "motor holding brake without feedback signals" and also enable "safe brake control" (p1278 = 1, p9602 = 1, p9802 = 1). Description:	Displays the safe maximum velocity (on the load side) that is permissible for the safe motion monitoring functions as a result of the actual value sensing. If safety is not enabled, the parameter has no significance and is set to "0".		
Note:	If the value displayed is exceeded, message C01711 is output indicating relevant subsequent faults.		
r9730	SI Motion Safe maximum velocity / SI mtn safe v_Max		
VECTOR_G130/G15 0 (Safety rot)	Can be changed: - Data type: FloatingPoint32 P-Group: Safety Integrated Not for motor type: - Min - [rpm]	Calculated: - Dynamic index: - Units group: - Scaling: - Max - [rpm]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting - [rpm]
Description:	Displays the safe maximum velocity (on the load side) that is permissible for the safe motion monitoring functions as a result of the actual value sensing. If safety is not enabled, the parameter has no significance and is set to "0".		
Note:	If the value displayed is exceeded, message C01711 is output indicating relevant subsequent faults.		
r9731	SI Motion safe position accuracy / SI Mtn pos acc		
VECTOR_G130/G15 0	Can be changed: - Data type: FloatingPoint32 P-Group: Safety Integrated Not for motor type: - Min - [mm]	Calculated: - Dynamic index: - Units group: - Scaling: - Max - [mm]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting - [mm]
Description:	Displays the safe position accuracy (on the load side) that can be achieved as a maximum for the safe motion monitoring functions as a result of the actual value sensing. If safety is not enabled, the parameter has no significance and is set to "0".		
r9731	SI Motion safe position accuracy / SI Mtn pos acc		
VECTOR_G130/G15 0 (Safety rot)	Can be changed: - Data type: FloatingPoint32 P-Group: Safety Integrated Not for motor type: - Min - [°]	Calculated: - Dynamic index: - Units group: - Scaling: - Max - [°]	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting - [°]
Description:	Displays the safe position accuracy (on the load side) that can be achieved as a maximum for the safe motion monitoring functions as a result of the actual value sensing. If safety is not enabled, the parameter has no significance and is set to "0".		

r9733[0...1]	CO: SI Motion setpoint speed limit effective / SI Mtn setp_lim		
VECTOR_G130/G15 0	Can be changed: - Data type: FloatingPoint32 P-Group: Safety Integrated Not for motor type: - Min - [rpm]	Calculated: - Dynamic index: - Units group: 3_1 Scaling: p2000 Max - [rpm]	Access level: 3 Func. diagram: - Unit selection: p0505 Expert list: 1 Factory setting - [rpm]
Description:	Displays the necessary setpoint speed limit as a result of the selected SI Motion monitoring functions. Contrary to the parameterization of the SI limit values, this parameter specifies the motor-side limit value and not the load-side limit value.		
Index:	[0] = Setpoint limiting positive [1] = Setpoint limiting negative		
Dependency:	r9733[0] = p9531[x] * p9533 r9733[1] = - p9531[x] * p9533 x = SLS stage selected Refer to: p9531, p9533		
Notice:	If p1051 = r9733[0] is interconnected, p1052 = r9733[1] must also be interconnected. If only the absolute value of the setpoint speed limit is required, r9733[0] is sufficient.		
Note:	The unit changeover between linear and rotary axis is not implemented via the safety changeover (p9502) but by the linear motor changeover. If the "SLS" function is not selected, r9733[0] shows p1082 and r9733[1] shows -p1082. The display in r9733 can be delayed by up to one Safety monitoring clock cycle as compared to the display in r9719/r9720 and r9721/r9722.		
r9744	SI message buffer changes, counter / SI msg_buffer chng		
VECTOR_G130/G15 0	Can be changed: - Data type: Unsigned16 P-Group: Messages Not for motor type: - Min -	Calculated: - Dynamic index: - Units group: - Scaling: - Max -	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting -
Description:	Displays the changes of the safety message buffer. This counter is incremented every time that the safety message buffer changes.		
Recommend.:	This is used to check whether the safety message buffer has been read out consistently.		
Dependency:	Refer to: r9747, r9748, r9749, p9752, r9753, r9754, r9755, r9756

	Min 0000 hex	Max FFFF FFFF hex	Factory setting 0000 hex
Description:	Enters a new Safety Integrated password.		
Dependency:	A change made to the Safety Integrated password must be acknowledged in the following parameter: Refer to: p9763		

p9763 SI password acknowledgement / SI ackn password

VECTOR_G130/G15 0	Can be changed: C2(95)	Calculated: -	Access level: 3
	Data type: Unsigned32	Dynamic index: -	Func. diagram: 2800
	P-Group: Safety Integrated	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0000 hex	Max FFFF FFFF hex	Factory setting 0000 hex

Description: Acknowledges the new Safety Integrated password.

Dependency: Refer to: p9762

Note: The new password entered into p9762 must be re-entered in order to acknowledge.
p9762 = p9763 = 0 is automatically set after the new Safety Integrated password has been successfully acknowledged.

r9765 SI Motion forced check procedure remaining time (Control Unit) / SI Mtn dyn remain

Description: Displays the Safety Integrated monitoring functions supported on the Control Unit and Motor Module.
The Control Unit determines this display.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	STO supported via terminals	Yes	No	2804
	01	SBC supported	Yes	No	2804
	02	SI Motion supported	Yes	No	2804
	03	SS1 supported	Yes	No	2804
	04	PROFIsafe supported for Extended Functions	Yes	No	-
	05	Drive-based motion monitoring functions supported	Yes	No	-
	06	PROFIsafe supported for Basic Functions	Yes	No	-
	07	Encoderless motion monitoring supported	Yes	No	-
	08	Safe Brake Adapter supported	Yes	No	-
	09	PROFIsafe supported BasicFunctions for parall circuit connection	Yes	No	-

Dependency: Refer to: r9871

Note: CU: Control Unit
SBC: Safe Brake Control
SI: Safety Integrated
SS1: Safe Stop 1
STO: Safe Torque Off / SH: Safe standstill

r9772.0...23 CO/BO: SI status (Control Unit) / SI status CU

VECTOR_G130/G150	Can be changed: -	Calculated: -	Access level: 2

	10	STOP A active	Yes	No	2802
	15	STOP F active	Yes	No	2802
	16	STO cse: Safety comm. mode	Yes	No	-
	17	STO cause selection via terminal (Basic Functions)	Yes	No	-
	18	STO cause: selection via SMM	Yes	No	-
	19	STO cause actual value missing	Yes	No	-

20	STO cause selection PROFIsafe (Basic Functions)	Yes	No	-
22	SS1 cause selection terminal (Basic Functions)	Yes	No	-
23	SS1 cause selection PROFIsafe (Basic Functions)	Yes	No	-

Dependency: Refer to: r9872

Note: Re bit 00:

When STO is selected, the cause is displayed in bits 16 ... 20.

Re bit 05:

When SS1 is selected, the cause is displayed in bits 22 and 23.

Re bit 18:

When the bit is set, STO is selected via PROFIsafe or Terminal Module 54F (TM54F).

Re bit 19:

With SMM encoderless no actual value sensing is possible on account of OFF2.

With SMM with encoder no actual value sensing is possible on account of parking.

SMM: Safe Motion Monitoring

Re bit 22 and 23:

These bits show via which path the SS1 has been triggered, i.e. what has started the SS1 delay time.

If the SS1 delay time is not started (e.g. because an STO is triggered at the same time), neither of the two bits is set.

	P-Group: Safety Integrated	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min	Max	Factory setting
	-	-	-

Description: Displays the status for Safety Integrated of the group to which this drive belongs.

These signals are an AND logic operation of the individual status signals of the drives included in this group.

Bit field:	Bit	Signal name	1 signal	0 signal	FP
	00	STO selected in group	Yes	No	2804
	01	STO active in group	Yes	No	2804
	02	SS1 delay time active in group	Yes	No	-

	06	SS1 active in group (Basic Functions)	Yes	No	-
	31	Shutdown paths of the group must be tested	Yes	No	2804

Dependency: Refer to: p9620, r9773

Notice: If a drive belonging to a group is deactivated via p0105, then the signals in r9774 can no longer be correctly displayed (Remedy: Before deactivating, remove this drive from the group).

Note: A group is formed by appropriately grouping the terminals for the function "Safe Torque Off" (STO).
The status of a group of n drives is, for drives 1 to n - 1 displayed with a delay of one monitoring clock cycle; this is a system-related effect.

	P-Group: Safety Integrated	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1

Description:	Sets the enable signal for the "Safe Brake Control" function (SBC) on the Motor Module. 0: Inhibit SBC 1: Enable SBC		
Dependency:	Refer to: p9602		
Note:	The "Safe Brake Control" function is not activated until at least one safety monitoring function has been enabled (i.e. p9501 not equal to 0 and/or p9801 not equal to 0). It does not make sense to parameterize "no motor holding brake available" and enable "Safe Brake Control" (p1215 = 0, p9602 = p9802 = 1) if there is no motor holding brake. The parameterization "motor holding brake the same as sequence control, connection via BICO" and "Safe Brake Control" enabled (p1215 = 3, p9602 = 1, p9802 = 1) is not practical. It is not permissible to parameterize "motor holding brake without feedback signals" and also enable "safe brake control" (p1278 = 1, p9602 = 1, p9802 = 1). MM: Motor Module SBC: Safe Brake Control SI: Safety Integrated

	0.00 [µs]	2000000.00 [µs]	500000.00 [µs]
Description:	Sets the tolerance time to change over the safety-related inputs (SGE) on the Motor Module. An SGE changeover is not effective simultaneously due to the different runtimes in the two monitoring channels. After an SGE changeover, dynamic data is not subject to a data cross-check during this tolerance time.		
Dependency:	Refer to: p9650		
Note:	For a data cross-check between p9650 and p9850, a difference of one Safety monitoring clock cycle is tolerated. The parameterized time is internally rounded-off to an integer multiple of the monitoring clock cycle. SGE: Safety-related input (e.g. STO terminals)

Description:	Sets the debounce time for the EP terminal of the Motor Module. The debounce time is rounded to whole milliseconds. The debounce time indicates the maximum duration of a fault pulse on the F-DIs, so that there are no negative effects on the SGEs. Example: Debounce time = 1 ms: Fault pulses of 1 ms are filtered; only pulses longer than 2 ms are processed. Debounce time = 3 ms: Fault pulses of 3 ms are filtered; only pulses longer than 4 ms are processed.		
Note:	Example: Debounce time = 1 ms: Fault pulses of 1 ms are filtered; only pulses longer than 2 ms are processed. Debounce time = 3 ms: Fault pulses of 3 ms are filtered; only pulses longer than 4 ms are processed.

	Min 0.00 [ms]	Max 300000.00 [ms]	Factory setting 0.00 [ms]
Description:	Sets the delay time of the pulse suppression for the function "Safe Stop 1" (SS1) on the Motor Module to brake along the OFF3 down ramp (p1135).		
Dependency:	Refer to: p1135, p9652		
Note:	For a data cross-check between p9652 and p9852, a difference of one Safety monitoring clock cycle is tolerated. The parameterized time is rounded internally to an integer multiple of the monitoring clock cycle. SS1: Safe Stop 1 (corresponds to Stop Category 1 acc. to EN60204)

Description:	Sets the transition period from STOP F to STOP A on the Motor Module.		
Dependency:	Refer to: p9658, r9895 Refer to: F30611		
Note:	For a data cross-check between p9658 and p9858, a difference of one Safety monitoring clock cycle is tolerated. Dependency: Refer to: r9772

Notice: If communication between the Control Unit and the Motor Module is interrupted (e.g. by switching off the Motor Module), this display parameter is no longer updated. The last transferred status of the Motor Module is displayed.

Note: Re bit 00:
When STO is selected, the cause is displayed in bits 16 ... 18 and in bit 20.
Re bit 05:
When SS1 is selected, the cause is displayed in bits 22 and 23.
Re bit 18:
When the bit is set, STO is selected via PROFIsafe or Terminal Module 54F (TM54F).
SMM: Safe Motion Monitoring
Re bit 22 and 23:
These bits show via which path the SS1 has been triggered, i.e. what has started the SS1 delay time.
If the SS1 delay time is not started (e.g. because an STO is triggered at the same time), neither of the two bits is set.

Description:	If, when comparing the actual topology and target topology, only error has occurred, that can be acknowledged, then using this parameter, a new comparison can be started - acknowledging the error in the target topology. Differences that can be acknowledged: - topology comparison, component shifted - topology comparison, serial number of a component has been detected to be different (byte 3 = 1) - topology comparison shows one component that is connected differently The following parameter values are available: p9904 = 1 --> the procedure is started. p9904 = 0 after starting --> the procedure has been successfully completed. p9904 = 1 after starting --> the procedure has not been successfully completed. The possible causes for an unsuccessful procedure are located in bytes 4, 3, 2. Byte 2: Number of structural differences. Byte 3: Number of differences that can be acknowledged (p9904). Byte 4: Number of differences. These differences can be resolved as follows: - sets the topology comparison (p9906 or p9907/p9908). - change over the actual topology. The appropriate action should be selected corresponding to the message that is displayed/output.		
Note:	In order to permanently accept the acknowledgement of the fault that can be resolved, then it must be saved in a non-volatile fashion (p0977).		
p9905	Device specialization / Specialization		
CU_G_G130, CU_G_G150	Can be changed: C1(1) Data type: Unsigned16 P-Group: Topology Not for motor type: - Min 0	Calculated: - Dynamic index: - Units group: - Scaling: - Max 2	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	With p9905 = 1, the serial numbers and the hardware versions of all of the components are transferred from the actual topology into the target topology and a new comparison is started.. For this device specialization, the components of the target topology may only differ from those of the actual topology by the serial numbers. With p9905 = 2, the serial numbers, the hardware versions and the order numbers of all of the components are transferred from the actual topology into the target topology and a new comparison is started.. For this device specialization, the components of the target topology may only differ from those of the actual topology by the serial numbers and order numbers.		
Note:	p9905 is automatically set to 0 at the end of the operation. In order to permanently accept the data, it is necessary to save in a non-volatile fashion (p0977).

Description:	Sets the type of comparison between the actual topology and target topology. The comparison is started by setting the required value.		
Value:	0: High: Compares the complete electronic rating plate 1: Average: Compares the component type and the Order number 2: Low: Compares the component type 3: Minimum: Compares the component class 99: Topology has different comparison stages		
Note:	The electronic rating plate comprises the following data: - component type (e.g. "SMC20") - Order No. (e.g. "6SL3055-0AA0-5BA0") - manufacturer (e.g. SIEMENS) - hardware version (e.g. "A") - Serial No. (e.g. "T-P30050495") When comparing the topology, the following data is compared in the target and actual topologies: p9906 = 0: Component type, Order No., Hardware version, Manufacturer, Serial No. p9906 = 1: Component type, Order No. p9906 = 2: Component type p9906 = 3: Component class (e.g. Sensor Module or Motor Module)

p9908	Topology comparison, comparison stage of a component / Topo_cmpr 1 comp		
CU_G_G130, CU_G_G150	Can be changed: C1(1) Data type: Integer16 P-Group: Topology Not for motor type: - Min 0	Calculated: - Dynamic index: - Units group: - Scaling: - Max 99	Access level: 3 Func. diagram: - Unit selection: - Expert list: 1 Factory setting 0
Description:	Sets the type of comparison of a component in the target topology with the actual topology. The comparison is started by setting the required value.		
Value:	0: High: Compares the complete electronic rating plate 1: Average: Compares the component type and the Order number 2: Low: Compares the component type 3: Minimum: Compares the component class 99: Topology has different comparison stages		

Dependency: Refer to: p9907

Note: The electronic rating plate comprises the following data:

- component type (e.g. "SMC20")
- Order No. (e.g. "6SL3055-0AA0-5BA0")
- manufacturer (e.g. SIEMENS)
- hardware version (e.g. "A")
- Serial No. (e.g. "T-P30050495")

When comparing the topology, the following data is compared in the target and actual topologies:

p9908 = 0: Component type, Order No., Hardware version, Manufacturer, Serial No.

p9908 = 1: Component type, Order No.

p9908 = 2: Component type

p9908 = 3: Component class (e.g. Sensor Module or Motor Module)

p9909		Topology comparison, component replacement / Topo_cmptr replace	
CU_G_G130, CU_G_G150	Can be changed: C1(1)	Calculated: -	Access level: 3

	P-Group: Topology	Units group: -	Unit selection: -
	Not for motor type: -	Scaling: -	Expert list: 1
	Min 0	Max 1	Factory setting 1
Description:	For p9909 = 1, the serial number and the hardware version of the new replaced component is automatically transferred from the actual topology into the target topology and then saved in a non-volatile fashion. For the components that have been replaced, the electronic rating plate must match as far as the following data is concerned: - component type (e.g. "SMC20") - Order No. (e.g. "6SL3055-0AA0-5BA0") For p9909 = 0, serial numbers and hardware versions are not automatically transferred. In this case, the transfer must be made using p9904.		
Dependency:	Refer to: p9904, p9905		
Note:	The modified target topology is automatically saved in a non-volatile fashion when the drive object runs-up (e.g. after a POWER ON). Special case for Control Unit and option slot modules: When replacing these components, independent of p9909, the serial number and hardware version are automatically transferred and saved in a non-volatile fashion.

Description:	Enters the license key for this drive unit. Example of the license key: EACZ-QBCA = 69 65 67 90 45 81 66 67 65 dec (ASCII characters) Index 0 = license key character 1 (e.g. 69 dec) Index 1 = license key character 2 (e.g. 65 dec) ... Index 19 = license key character 20 (e.g. 0 dec) With the STARTER commissioning software, ASCII characters are not entered coded, i.e. the characters of the license key can be entered as printed in the Certificate of License. In this case, STARTER codes the characters.		
Dependency:	Refer to: r7843, p9921 Refer to: A13000, A13001, F13010		
Notice:	An ASCII table (excerpt) can be found, for example, in the Appendix of the List Manual:		
Note:	Only the ASCII characters, contained in a license key can be entered. When changing p9920[x] to the value 0, all of the following indices are also set to 0. After entering the license key, the license key must be activated (p9921). If the licensing is not adequate, then the following alarm is displayed together with LED: - A13000 --> licensing not sufficient - LED READY --> flashes green/red with 0.5 Hz

Description:

Sets the wait time for testing the digital outputs 0 ... 3 (DO 0 ... DO 3).

Within this time, for a forced checking procedure of the digital outputs, the signal must have been detected via the corresponding digital input DI 20 ... DI 23.

Dependency:

Refer to: p10003, p10007, p10041, p10046

Note:

The wait time must be set to a value greater than parameter p10017.

The duration of the test stop is adapted to the debounce time set in p10017 automatically if the wait time in p10001 should be less than the debounce time.

 3: Test mode 3 read back F-DO in DI (actuator with feedback signal)

Note: When test mode 1 is being used, too great a load resistance on the part of the load between DO+ and DO- can lead to problems during the test stop. It is, therefore, important to make sure that the load resistance on an individual FDO does not exceed 10 Kohm.

Description:	Displays the single-channel, logical, and debounced status of the safety digital inputs F-DI 0 .. 9 at Terminal Module 54F (TM54F).				
	If a safety function is assigned to an input (e.g. via p10022), then the following applies:				
	- logical "0": Safety function is selected				
	- logical "1": Safety function is deselected				
	The interrelationship between the logical level and the external voltage level at the input depends on the parameterization (refer to p10040) of the input as either NC or NO contact and is aligned to the use of a safety function:				
	With 24 V at the input, NC contacts have a logical "1" level, for 0 V at the input, a logical "0" level.				
	This means that an NC/NC contact parameterization of 0 V at both inputs of the F-DI selects the safety function, for 24 V at both inputs, deselects the safety function.				
	With 24 V at the input, NO contacts have a logical "0" level, for 0 V at the input, a logical "1" level.				
	This means that for an NC/NO contact parameterization, the level 0 V/24 V selects the safety function, the level 24 V/0 V deselects the safety function.

1.3.2 Parameters for drive data sets (DDS)

The following list contains the parameters that are dependent on the drive data sets.

Product: SINAMICS G130/G150, Version: 4301400, Language: eng, Type: DDS

p0186[0...n]	Motor Data Sets (MDS) number / MDS number
p0187[0...n]	Encoder 1 encoder data set number / Enc 1 EDS number
p0188[0...n]	Encoder 2 encoder data set number / Enc 2 EDS number
p0189[0...n]	Encoder 3 encoder data set number / Enc 3 EDS number
p0340[0...n]	Automatic calculation, motor/control parameters / Calc auto par
p0572[0...n]	Activate inhibit list / Act inhib list
p0578[0...n]	Calculate parameters that are dependent on the technology/units / Calc tec par
p0640[0...n]	Current limit / Current limit
p1001[0...n]	CO: Fixed speed setpoint 1 / n_set_fixed 1
p1002[0...n]	CO: Fixed speed setpoint 2 / n_set_fixed 2
p1003[0...n]	CO: Fixed speed setpoint 3 / n_set_fixed 3
p1004[0...n]	CO: Fixed speed setpoint 4 / n_set_fixed 4
p1005[0...n]	CO: Fixed speed setpoint 5 / n_set_fixed 5
p1006[0...n]	CO: Fixed speed setpoint 6 / n_set_fixed 6

p1325[0...n]	V/f control programmable characteristic voltage 3 / Vf char U3
p1326[0...n]	V/f control programmable characteristic frequency 4 / Vf char f4
p1327[0...n]	V/f control programmable characteristic voltage 4 / Vf char U4
p1333[0...n]	V/f control FCC starting frequency / V/f FCC f_start
p1334[0...n]	V/f control slip compensation starting frequency / Slip comp start
p1335[0...n]	Slip compensation, scaling / Slip comp scal
p1336[0...n]	Slip compensation limit value / Slip comp lim val
p1338[0...n]	V/f mode resonance damping gain / Vf Res_damp gain
p1339[0...n]	V/f mode resonance damping filter time constant / Vf Res_damp T
p1340[0...n]	I_max frequency controller proportional gain / I_max_ctrl Kp
p1341[0...n]	I_max frequency controller integral time / I_max_ctrl Tn
p1345[0...n]	I_max voltage controller proportional gain / I_max_V_ctrl Kp
p1346[0...n]	I_max voltage controller integral time / I_max_V_ctrl Tn
p1349[0...n]	V/f mode resonance damping maximum frequency / Vf res_damp F_max
p1350[0...n]	Soft starting / Soft starting
p1351[0...n]	CO: Motor holding brake starting frequency / Brake f_start
p1358[0...n]	Angular difference, symmetrizing, actual angle / Sym act angle
p1400[0...n]	Speed control configuration / n_ctrl config
p1401[0...n]	Flux control configuration / Flux ctrl config
p1402[0...n]	Closed-loop current control and motor model configuration / I_ctrl config
p1416[0...n]	Speed setpoint filter 1 time constant / n_set_filt 1 T
p1428[0...n]	Speed pre-control balancing dead time / n_prectrBal t_dead
p1429[0...n]	Speed pre-control balancing time constant / n_prectr bal T
p1433[0...n]	Speed controller reference model natural frequency / n_ctrl RefMod fn
p1434[0...n]	Speed controller reference model damping / n_ctrl RefMod D
p1435[0...n]	Speed controller reference model dead time / n_ctrRefMod t_dead
p1441[0...n]	Actual speed smoothing time / n_ist T_smooth
p1442[0...n]	Speed controller speed actual value smoothing time / n_ctr n_act T_smth
p1451[0...n]	Motor model speed actual value smoothing time SLVC / Mot_mod n_act t_sm
p1452[0...n]	Speed controller speed actual value smoothing time (SLVC) / n_C n_act T_s SLVC
p1456[0...n]	Speed controller P gain adaptation lower starting point / n_ctrl AdaptKpLow
p1457[0...n]	Speed controller P gain adaptation upper starting point / n_ctrl AdaptKp up
p1458[0...n]	Adaptation factor, lower / Adapt_factor lower
p1459[0...n]	Adaptation factor, upper / Adapt_factor upper

p1460[0...n]	Speed controller P gain adaptation speed, lower / n_ctrl Kp n lower
p1461[0...n]	Speed controller Kp adaptation speed, upper scaling / n_ctrl Kp n upper
p1462[0...n]	Speed controller integral time adaptation speed lower / n_ctrl Tn n lower
p1463[0...n]	Speed controller Tn adaptation speed, upper scaling / n_ctrl Tn n upper
p1464[0...n]	Speed controller adaptation speed, lower / n_ctrl n lower
p1465[0...n]	Speed controller adaptation speed, upper / n_ctrl n upper
p1470[0...n]	Speed controller encoderless operation P-gain / n_ctrl SLVC Kp
p1472[0...n]	Speed controller encoderless operation integral time / n_ctrl SLVC Tn
p1487[0...n]	Droop compensation torque scaling / Droop M_comp scal
p1488[0...n]	Droop input source / Droop input source
p1489[0...n]	Droop feedback scaling / Droop scaling

p0425[0...n]	Encoder, rotary zero mark distance / Enc rot dist ZM
p0426[0...n]	Encoder zero mark differential distance / Enc diff distance
p0427[0...n]	Encoder SSI baud rate / Enc SSI baud rate
p0428[0...n]	Encoder SSI monoflop time / Enc SSI t_monoflop
p0429[0...n]	Encoder SSI configuration / Enc SSI config
p0430[0...n]	Sensor Module configuration / SM config
p0431[0...n]	Angular commutation offset / Ang_com offset
p0432[0...n]	Gearbox factor, encoder revolutions / Grbx_fact enc_rev
p0433[0...n]	Gearbox factor, motor/load revolutions / Grbx_fact mot_rev
p0434[0...n]	Encoder SSI error bit / Enc SSI error bit
p0435[0...n]	Encoder SSI alarm bit / Enc SSI alarm bit
p0436[0...n]	Encoder SSI parity bit / Enc SSI parity bit
p0437[0...n]	Sensor Module configuration extended / SM config ext
p0438[0...n]	Squarewave encoder filter time / Enc t_filt
p0439[0...n]	Encoder ramp-up time / Enc ramp-up time
p0440[0...n]	Copy encoder serial number / Copy enc ser_no
p0441[0...n]	Encoder commissioning serial number part 1 / Enc comm ser_no 1
p0442[0...n]	Encoder commissioning serial number part 2 / Enc comm ser_no 2
p0443[0...n]	Encoder commissioning serial number part 3 / Enc comm ser_no 3
p0444[0...n]	Encoder commissioning serial number part 4 / Enc comm ser_no 4
p0445[0...n]	Encoder commissioning serial number part 5 / Enc comm ser_no 5
p0446[0...n]	Encoder SSI number of bits before the absolute value / Enc SSI bit before
p0447[0...n]	Encoder SSI number of bits absolute value / Enc SSI bit val
p0448[0...n]	Encoder SSI number of bits after the absolute value / Enc SSI bit after
p0449[0...n]	Encoder SSI number of bits, filler bits / Enc SSI fill bits
p0453[0...n]	Measuring time pulse encoder evaluation zero speed / t_meas enc_eva n_0
p0493[0...n]	Zero mark selection, input terminal / ZM_sel inp_term
p4600[0...n]	Motor temperature sensor 1 sensor type / Temp_sens 1 type
p4601[0...n]	Motor temperature sensor 2 sensor type / Temp_sens 2 type
p4602[0...n]	Motor temperature sensor 3 sensor type / Temp_sens 3 type
p4603[0...n]	Motor temperature sensor 4 sensor type / Temp_sens 4 type
p4670[0...n]	Analog sensor configuration / Ana_sens config
p4671[0...n]	Analog sensor input / Ana_sens inp
p4672[0...n]	Analog sensor channel A voltage at actual value zero / Ana_sens A U at 0
p4673[0...n]	Analog sensor channel A voltage per encoder period / Ana_sens A U/per
p4674[0...n]	Analog sensor channel B voltage at actual value zero / Ana_sens B U at 0
p4675[0...n]	Analog sensor channel B voltage per encoder period / Ana_sens B U/per
p4676[0...n]	Analog sensor range limit threshold / Ana_sens lim thr
p4677[0...n]	Analog sensor LVDT configuration / Ana_sens LVDT conf
p4680[0...n]	Zero mark monitoring tolerance permissible / ZM_monit tol perm
p4681[0...n]	Zero mark monitoring, tolerance window limit 1 positive / ZM tol lim 1 pos
p4682[0...n]	Zero mark monitoring, tolerance window limit 1 negative / ZM tol lim 1 neg
p4683[0...n]	Zero mark monitoring tolerance window alarm threshold positive / ZM tol A_thr pos
p4684[0...n]	Zero mark monitoring tolerance window alarm threshold negative / ZM tol A_thr neg
p4685[0...n]	Speed actual value mean value generation / n_act mean val
p4686[0...n]	Zero mark minimum length / ZM min length

1.3.4 Parameters for motor data sets (MDS)

The following list contains the parameters that are dependent on the motor data sets.

Product: SINAMICS G130/G150, Version: 4301400, Language: eng, Type: MDS

p0131[0...n]	Motor component number / Mot comp_no
p0300[0...n]	Motor type selection / Mot type sel

p0309[0...n]	Rated motor efficiency / Mot eta _{rated}
p0310[0...n]	Rated motor frequency / Mot f _{rated}
p0311[0...n]	Rated motor speed / Mot n _{rated}
r0313[0...n]	Motor pole pair number, actual (or calculated) / Mot PolePairNo act
p0314[0...n]	Motor pole pair number / Mot pole pair No.
p0316[0...n]	Motor torque constant / Mot kT
p0318[0...n]	Motor stall current / Mot I _{standstill}
p0320[0...n]	Motor rated magnetizing current/short-circuit current / Mot I _{mag_{rated}}
p0322[0...n]	Maximum motor speed / Mot n _{max}
p0323[0...n]	Maximum motor current / Mot I _{max}
p0324[0...n]	Winding maximum speed / Winding n _{max}
p0325[0...n]	Motor pole position identification current, 1st phase / Mot PolID 1 1st ph
p0327[0...n]	Optimum motor load angle / Mot phi _{load opt}
p0328[0...n]	Motor reluctance torque constant / Mot kT _{reluctance}
p0329[0...n]	Motor pole position identification current / Mot PolID current
r0330[0...n]	Rated motor slip / Mot slip _{rated}
r0331[0...n]	Actual motor magnetizing current/short-circuit current / Mot I _{mag_{rtd}} act
r0332[0...n]	Rated motor power factor / Mot cos_phi _{rated}
r0333[0...n]	Rated motor torque / Mot M _{rated}
r0334[0...n]	Actual motor-torque constant / Mot kT act
p0335[0...n]	Motor cooling type / Motor cooling type
r0336[0...n]	Actual rated motor frequency / Mot f _{rated} act
r0337[0...n]	Rated motor EMF / Mot EMF _{rated}
r0339[0...n]	Rated motor voltage / Mot V _{rated}
p0341[0...n]	Motor moment of inertia / Mot M _{mom of inert}
p0342[0...n]	Ratio between the total and motor moment of inertia / Mot MomInert Ratio
r0343[0...n]	Identified motor rated current / Mot I _{rated} ident
p0344[0...n]	Motor weight (for the thermal motor model) / Mot weight th mod
r0345[0...n]	Nominal motor starting time / Mot t _{start_{rated}}
p0346[0...n]	Motor excitation build-up time / Mot t _{excitation}
p0347[0...n]	Motor de-excitation time / Mot t _{de-excitat.}
p0350[0...n]	Motor stator resistance, cold / Mot R _{stator cold}
p0352[0...n]	Cable resistance / Mot R _{cable cold}
p0353[0...n]	Motor series inductance / Mot L _{series}
p0354[0...n]	Motor rotor resistance cold / damping resistance d axis / Mot R _{r cold} / RDd
p0355[0...n]	Motor damping resistance, q axis / Mot R _{damp q}
p0356[0...n]	Motor stator leakage inductance / Mot L _{stator leak.}
p0357[0...n]	Motor stator inductance, d axis / Mot L _{stator d}

p0358[0...n]	Motor rotor leakage inductance / damping inductance, d axis / Mot L_r leak / LDd
p0359[0...n]	Motor damping inductance, q axis / Mot L_damp q
p0360[0...n]	Motor magnetizing inductance/magn. inductance, d axis saturated / Mot Lh/Lh d sat
p0361[0...n]	Motor magnetizing inductance q axis, saturated / Mot L_magn q sat

Delay (switch-on and switch-off)

The digital signal x must have the value "1" without interruption during time T_1 or must have the value "0" during time T_2 before output y changes its signal state.

2nd-order filter (bandstop/general filter)

ρ_{xxx} = time constant

<u>Natural frequency, denominator</u> f_{n_n} pxxxx	<u>Damping, denominator</u> D_n pxxxx
Used as bandstop filter - center frequency fs:	
	$f_{n_z} = f_s$ $f_{n_n} = f_s$
- bandwidth f_B:	
	$D_z = 0$ $D_n = \frac{f_B}{2 \cdot f_s}$

$$H(s) = \frac{\left(\frac{s}{2\pi f_{n_z}}\right)^2 + \frac{2 \cdot D_z}{2\pi f_{n_z}} \cdot s + 1}{\left(\frac{s}{2\pi f_{n_n}}\right)^2 + \frac{2 \cdot D_n}{2\pi f_{n_n}} \cdot s + 1}$$

Analog adder can be activated

The following applies to $l = 0$ signal: $y = x_1$

S Natural frequency, denominator

$$H(s) = \frac{1}{\left(\frac{s}{2\pi f_n}\right)^2 + \frac{2 \cdot D_n}{2\pi f_n} \cdot s + 1}$$

Handling BICO technology

Binector:

Binectors are binary signals that can be freely interconnected (BO = Binector Output). They represent a bit of a "BO:" display parameter (e.g. bit 15 from r0723).

Connector:

Connectors are "analog signals" that can be freely interconnected (e.g. percentage variables, speeds or torques). Connectors are also "CO:" display parameters (CO = Connector Output).

Parameterization:

At the signal destination, the required binector or connector is selected using appropriate parameters:

"BI:" parameter for binectors (BI = Binector Input)

or

"CI:" parameter for connectors (CI = Connector Input)

Example:

The main setpoint for the speed controller (CI: p1070) should be received from the output of the motorized potentiometer (CO: r1050) and the "jog" command (BI: p1055) from digital input DI 0 (BO: r0722.0, X122.1 terminal) on the CU320.

Parameterizing steps:

- ① p1055[0] = 722.0 Terminal X122.1 acts as "Jog bit 0".
- ② p1070[0] = 1050 The output of the motorized potentiometer acts as main setpoint for the speed controller.

- <1> Shutdown threshold of the standstill detection. In this case (e.g. when using a brake), another criterion than the speed actual value can be selected to clear the pulses. Otherwise, we recommend to keep the factory setting.
- <2> For p1276 = 300.000 s, the timer is de-activated, i.e. the timer output is always 0. Note: When operating a motor with a brake which must not be applied while the motor is rotating, the monitoring time of both timers must be set to 300 s.
- <3> For operation without brake, p1224[0...3] must be 0 (factory setting) in order to avoid undesirable interaction with the sequence control.
- <4> The internal signal comprises signals that lead to OFF1 or OFF3, e.g. BICO or fault response.
- <5> Only for SINAMICS S120.

Changing the fault response for maximum 20 faults <1>

Changing the message type - fault <==> alarm for maximum 20 faults/alarms <1>

Changing the acknowledge mode for maximum 20 faults <1>

<1> The fault response, acknowledge mode and message type for all faults and alarms are set to meaningful default values in the factory setting. Changes that may be required are only possible in specific value ranges specified by SIEMENS. When the message type is changed, the supplementary information is transferred from fault value r0949 to alarm value r2124 and vice versa.

3.1 Overview of faults and alarms

3.1.1 General information about faults and alarms

Displaying faults and alarms

If a fault occurs, the drive indicates the fault(s) and/or alarm(s).

The following methods for displaying faults and alarms are available:

- Via the fault and alarm buffer with PROFIBUS
- Online via the commissioning software

Differences between faults and alarms

The differences between faults and alarms are as follows:

Table 3-1 Differences between faults and alarms

Type	Description
Faults	What happens when a fault occurs? • The appropriate fault reaction is triggered. • Status signal ZSW1.3 is set. • The fault is entered in the fault buffer. How are faults eliminated? • Remove the original cause of the fault. • Acknowledge the fault.
Alarms	What happens when an alarm occurs? • Status signal ZSW1.7 is set. • The alarm is entered in the alarm buffer. How are alarms eliminated? • Alarms acknowledge themselves. If the cause of the alarm is no longer present, they automatically reset themselves.

Fault reactions

The following fault reactions are defined:

Table 3-2 Fault reactions

List	PROFId- rive	Reaction	Description
NONE	-	None	No reaction when a fault occurs Note: When the "Basic positioner" function module is activated (r0108.4 = 1), the following applies: When a fault occurs with fault reaction "NONE", an active traversing task is interrupted and the system switches to tracking mode until the fault has been rectified and acknowledged.
OFF1	ON/ OFF	Brake along the ramp-function generator deceleration ramp followed by pulse disable	Closed-loop speed control (p1300 = 20, 21) • n_set = 0 is input immediately to brake the drive along the ramp-function generator deceleration ramp (p1121). • When zero speed is detected, the motor holding brake (if parameters have been assigned for it) is closed (p1215). The pulses are suppressed when the brake closing time (p1217) expires. Zero speed is detected if the actual speed drops below the threshold in p1226 or if the monitoring time (p1227) started when speed setpoint ≤ speed threshold (p1226) has expired. Closed-loop torque control (p1300 = 23) • The following applies to closed-loop torque control mode: Reaction as for OFF2 • When the system switches to closed-loop control with p1501, the following applies: No separate braking reaction. If the actual speed value drops below the speed threshold (p1226) or the timer stage (p1227) has expired, the motor holding brake (if one is being used) is closed. The pulses are suppressed when the brake closing time (p1217) expires.
OFF2	COAST STOP	Internal/external pulse disable	Closed-loop speed and torque control • Instantaneous pulse suppression, the drive "coasts" to a standstill. • The motor holding brake (if one is being used) is closed immediately. • Switching on inhibited is activated.

Table 3-2 Fault reactions, continued

List	PROFId- rive	Reaction	Description
OFF3	QUICK STOP	Brake along the OFF3 decelera- tion ramp fol- lowed by pulse disable	Closed-loop speed control (p1300 = 20, 21) • n_set = 0 is input immediately to brake the drive along the OFF3 deceleration ramp (p1135). • When zero speed is detected, the motor holding brake (if parameters have been assigned for it) is closed. The pulses are suppressed when the holding brake's closing time (p1217) expires. Zero speed is detected if the actual speed drops below the threshold in p1226 or if the monitoring time (p1227) started when speed setpoint <= speed threshold (p1226) has expired. • Switching on inhibited is activated. Closed-loop torque control (p1300 = 23) • Changeover to speed-controlled operation and other reactions as described for speed-controlled operation.
STOP1	-	-	Under development
STOP2	-	n_set = 0	• n_set = 0 is input immediately to brake the drive along the OFF3 deceleration ramp (p1135). • The drive remains in closed-loop speed control mode.
IASC/ DCBRAKE	-	-	• For synchronous motors, the following applies: If a fault occurs with this fault reaction, an internal arma- ture short-circuit is triggered. The conditions for p1231 = 4 must be observed. • For induction motors, the following applies: If a fault occurs with this fault reaction, DC-injection braking is triggered. The DC brake must have been put into operation (p1232, p1233, p1234).
ENCODER	-	Internal/external pulse disable (p0491)	The fault reaction ENCODER is applied as a function of the setting in p0491. Factory setting: p0491 = 0 --> Encoder fault causes OFF2 Notice: When changing p0491, it is imperative that the information in the description of this parameter is carefully observed.

Acknowledging faults

The list of faults and alarms specifies how to acknowledge each fault after the cause has been remedied.

Table 3-3 Acknowledging faults

Acknowledgment	Description								
POWER ON	The fault is acknowledged by a POWER ON process (switch drive unit off and on again). Note: If this action has not eliminated the fault cause, the fault is displayed again immediately after power up.								
IMMEDIATE	Faults can be acknowledged on one drive object (Points 1 to 3) or on all drive objects (point 4) as follows: 1 Acknowledge by setting parameter: p3981 = 0 --> 1 2 Acknowledge via binector inputs: <table border="0"> <tr> <td>p2103</td> <td>BI: 1. Acknowledge faults</td> </tr> <tr> <td>p2104</td> <td>BI: 2. Acknowledge faults</td> </tr> <tr> <td>p2105</td> <td>BI: 3. Acknowledge faults</td> </tr> </table> 3 Acknowledge using PROFIBUS control signal: STW1.7 = 0 --> 1 (edge) 4 Acknowledge all faults <table border="0"> <tr> <td>p2102</td> <td>BI: Acknowledge all faults</td> </tr> </table> All of the faults on all of the drive objects of the drive system can be acknowledged using this binector input. Note: • These faults can also be acknowledged by a POWER ON operation. • If this action has not eliminated the fault cause, the fault will continue to be displayed after acknowledgment. • Safety Integrated faults The "Safe standstill" (SH) function must be deselected before these faults are acknowledged.	p2103	BI: 1. Acknowledge faults	p2104	BI: 2. Acknowledge faults	p2105	BI: 3. Acknowledge faults	p2102	BI: Acknowledge all faults
p2103	BI: 1. Acknowledge faults								
p2104	BI: 2. Acknowledge faults								
p2105	BI: 3. Acknowledge faults								
p2102	BI: Acknowledge all faults								
PULSE INHIBIT	The fault can only be acknowledged with a pulse inhibit (r0899.11 = 0). The same options are available for acknowledging as described under acknowledgment with IMMEDIATE.								

Saving fault buffer on POWER OFF

The contents of the fault buffer are saved to a non-volatile storage medium when the Control Unit 320 (CU320) is switched off (i.e. the fault buffer history is still available when the unit is switched on again).

Note:

Requirements:

- Firmware version 2.2 or higher.
- Control Unit 320 (CU320) with hardware version C or higher.
The hardware version is shown on the rating plate or can be displayed online with the commissioning software (in Project Navigator under "Drive Unit" --> Configuration --> Version Overview).

If these prerequisites are not fulfilled, the contents of the fault buffer are deleted at every POWER ON operation.

The fault buffer of a drive object comprises the following parameters:

- r0945[0 to 63], r0947[0 to 63], r0948[0 to 63], r0949[0 to 63]
- r2109[0 to 63], r2130[0 to 63], r2133[0 to 63], r2136[0 to 63]

The fault buffer contents can be deleted manually as follows:

- Delete fault buffer for all drive objects:
p2147 = 1 --> p2147 = 0 is automatically set after execution.
- Delete fault buffer for a specific drive object:
p0952 = 0 --> The parameter belongs to the specified drive object.

The fault buffer contents are automatically deleted when the following occurs:

- Restore factory setting (p0009 = 30 and p0976 = 1).
- Download with modified structure (e.g. number of drive objects changed)
- Power-up after other parameter values have been loaded (e.g. p0976 = 10)
- Upgrade firmware to later version

3.1.2 Explanation of the list of faults and alarms

The data in the following example has been chosen at random. A description can contain the information listed below. Some of the information is optional.

The list of faults and alarms (See Section 3.2) is structured as follows:

----- **Start of example** -----

Axxxxx (F, N)	Fault location (optional): Name
Message value:	Component Number: %1, cause: %2
Drive object:	List of objects.
Reaction:	NONE
Acknowledgment:	NONE
Cause:	Description of possible causes Fault value (r0949, interpret format): or alarm value (r2124, interpret format): (optional) Information about fault or alarm values (optional)
Remedy:	Description of possible remedies
Reaction to F:	A_INFEED: OFF2 (OFF1, NONE) SERVO: NONE (OFF1, OFF2, OFF3) VECTOR: NONE (OFF1, OFF2, OFF3)
Acknowledgment for F:	IMMEDIATELY (POWER ON)
Reaction to N:	NONE
Acknowledgment:	

Axxxxx	Alarm xxxxx
Axxxxx (F, N)	Alarm xxxxx (message type can be changed to F or N)
Fxxxxx	Fault xxxxx
Fxxxxx (A, N)	Fault xxxxx (message type can be changed to F or N)
Nxxxxx	No message
Nxxxxx (A)	No message (message type can be changed to A)
Cxxxxx	Safety message (separate message buffer)

A message comprises a letter followed by the relevant number.

The letters have the following meanings:

- A means "Alarm".
- F means "Fault".
- N means "No message" or "Internal message".
- C means "Safety message"

The optional brackets indicate whether the type specified for this message can be changed and which message types can be adjusted via parameters (p2118, p2119).

Information about reaction and acknowledgment is specified independently for a message with an adjustable message type (e.g. reaction to F, acknowledgment for F).

Note:

You can change the default properties of a fault or alarm by means of parameter assignment.

The list of faults and alarms (see Section 3.2) provides information in relation to the properties of a message that have been set as standard. If the properties of a specific message are changed, the corresponding information may have to be modified in this list.

Fault location (optional): Name

The fault location (optional), the name of the fault or alarm, and the message number are all used to identify the message (e.g. with the commissioning software).

Message value:

The information provided under the message value tells you about the composition of the fault/alarm value.

Example:

Message value: Component Number: %1, cause: %2

This fault value or alarm value contains information about the Component Number and cause. The entries %1 and %2 are placeholders, which are filled in accordingly during online operation with the commissioning software.

Drive object:

Each message (fault/alarm) specifies the drive object in which it can be found.

A message can belong to either one, several, or all drive objects.

Reaction: Default fault reaction (adjustable fault reaction)

Specifies the default reaction in the event of a fault.

The optional brackets indicate whether the default fault reactions can be changed and which fault reactions can be adjusted via parameters (p2100, p2101).

Note:

See Section 3.1.1

Acknowledgment: Default acknowledgment (adjustable acknowledgment)

Specifies the default method of acknowledging faults after the cause has been eliminated.

The optional brackets indicate whether the default acknowledgment can be changed and which acknowledgment can be adjusted via parameters (p2126, p2127).

Note:

See Section 3.1.1

Cause:

Describes the possible causes of the fault/alarm. A fault or alarm value can also be specified (optional).

Fault value (r0949, format):

The fault value is entered in the fault buffer in r0949[0 to 63] and specifies additional, precise information about a fault.

Alarm value (r2124, format):

The alarm value specifies additional, precise information about an alarm.

The alarm value is entered in the alarm buffer in r2124[0 to 7] and specifies additional, precise information about an alarm.

Remedy:

Describes the methods available for eliminating the cause of the active fault or alarm.

Alarm

In certain cases, the servicing and maintenance personnel are responsible for choosing a suitable method for eliminating the cause of faults.

3.1.3 Number ranges of faults and alarms

Note:

The following number ranges represent an overview for all faults and alarms in SINAMICS.

The faults and alarms for the product described in this List Manual are described in detail in Section 3.2.

Faults and alarms are organized into the following number ranges:

Table 3-4 Number ranges of faults and alarms

F01000	Internal software error
Message value:	%1
Drive object:	All objects
Reaction:	OFF2
Acknowledge:	POWER ON
Cause:	An internal software error has occurred. Fault value (r0949, interpret hexadecimal): Only for internal Siemens troubleshooting.
Remedy:	- carry out a POWER ON (power off/on) for all components. - upgrade firmware to later version. - contact the Hotline. - replace the Control Unit.
F01001	Floating point exception
Message value:	%1
Drive object:	All objects
Reaction:	OFF2
Acknowledge:	POWER ON
Cause:	A floating point exception has occurred. The error can be caused by the basic system, DCC, FBLOCKS or OA_applications. Additional debug information can be found in p9999: Index 0: Alarm number Index 1: Program counter at the time the exception occurred Index 2: Cause of floating point exception: To be treated as a hexadecimal: 0x1 - Invalid operation 0x2 - Divide by zero 0x4 - Overflow 0x8 - Underflow 0x10 - Inexact result
Remedy:	- carry out a POWER ON (power off/on) for all components. - check configuration and signals of the free function blocks. - check configuration and signals of the DCC charts. - upgrade firmware to later version. - contact the Hotline.
F01002	Internal software error
Message value:	%1
Drive object:	All objects
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	An internal software error has occurred. Fault value (r0949, interpret hexadecimal): Only for internal Siemens troubleshooting.
Remedy:	- carry out a POWER ON (power off/on) for all components. - upgrade firmware to later version. - contact the Hotline.

F01003 Acknowledgement delay when accessing the memory

Message value: %1
Drive object: All objects
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: A memory area was accessed that does not return a "READY".
Fault value (r0949, interpret hexadecimal):
Only for internal Siemens troubleshooting.
Remedy: - carry out a POWER ON (power off/on) for all components.
- contact the Hotline.

N01004 (F, A) Internal software error

Message value: %1
Drive object: All objects
Reaction: NONE
Acknowledge: NONE
Cause: An internal software error has occurred.
Fault value (r0949, hexadecimal):
Only for internal Siemens troubleshooting.
Remedy: - read out diagnostics parameter (r9999).
- contact the Hotline.

F01005 Firmware download for DRIVE-CLiQ component unsuccessful

Message value: Component number: %1, fault cause: %2
Drive object: All objects
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: It was not possible to download the firmware to a DRIVE-CLiQ component.
Fault value (r0949, interpret hexadecimal):
yyxxxx hex: yy = component number, xxxx = fault cause
xxxx = 000B hex = 11 dec:
DRIVE-CLiQ component has detected a checksum error.
xxxx = 000F hex = 15 dec:
The selected DRIVE-CLiQ component did not accept the contents of the firmware file.
xxxx = 0012 hex = 18 dec:
Firmware version is too old and is not accepted by the component.
xxxx = 0013 hex = 19 dec:
Firmware version is not suitable for the hardware release of the component.
xxxx = 0065 hex = 101 dec:
After several communication attempts, no response from the DRIVE-CLiQ component.
xxxx = 008B hex = 139 dec:
Initially, a new boot loader is loaded (must be repeated after POWER ON).
xxxx = 008C hex = 140 dec:
Firmware file for the DRIVE-CLiQ component not available on the memory card.
xxxx = 008D hex = 141 dec:
An inconsistent length of the firmware file was signaled. The firmware download may have been caused by a loss of connection to the firmware file. This can occur during a project download/reset in the case of a SINAMICS Integrated Control Unit, for example.
xxxx = 008F hex = 143 dec:
Component has not changed to the mode for firmware download. It was not possible to delete the existing firmware.
xxxx = 0090 hex = 144 dec:
When checking the firmware that was downloaded (checksum), the component detected a fault. It is possible that the file on the memory card is defective.

xxxx = 0091 hex = 145 dec:
 Checking the loaded firmware (checksum) was not completed by the component in the appropriate time.
 xxxx = 009C hex = 156 dec:
 Component with the specified component number is not available (p7828).
 xxxx = Additional values:
 Only for internal Siemens troubleshooting.

Remedy:

- check the selected component number (p7828).
- check the DRIVE-CLiQ connection.
- save suitable firmware file for download in the directory "/siemens/sinamics/code/sac/".
- use a component with a suitable hardware version
- after POWER ON has been carried out again for the DRIVE-CLiQ component, download the firmware again.

Depending on p7826, the firmware will be automatically downloaded.

A01006 Firmware update for DRIVE-CLiQ component required

Message value: Component number: %1
Drive object: All objects
Reaction: NONE
Acknowledge: NONE
Cause: The firmware of a DRIVE-CLiQ component must be updated as there is no suitable firmware or firmware version in the component for operation with the Control Unit.
 Alarm value (r2124, interpret decimal):
 Component number of the DRIVE-CLiQ component.

Remedy: Firmware update using the commissioning software:
 The firmware version of all of the components on the "Version overview" page can be read in the Project Navigator under "Configuration" of the associated drive unit and an appropriate firmware update can be carried out.
 Firmware update via parameter:
 - take the component number from the alarm value and enter into p7828.
 - start the firmware download with p7829 = 1.

A01007 POWER ON for DRIVE-CLiQ component required

Message value: Component number: %1
Drive object: All objects
Reaction: NONE
Acknowledge: NONE
Cause: A DRIVE-CLiQ component must be powered up again (POWER ON) as, for example, the firmware was updated.
 Alarm value (r2124, interpret decimal):
 Component number of the DRIVE-CLiQ component.
 Note:
 For a component number = 1, a POWER ON of the Control Unit is required.

Remedy: Switch off the power supply of the specified DRIVE-CLiQ component and switch it on again.

A01009 (N) CU: Control module overtemperature

Message value: -
Drive object: All objects
Reaction: NONE
Acknowledge: NONE
Cause: The temperature (r0037[0]) of the control module (Control Unit) has exceeded the specified limit value.

Remedy:

- check the air intake for the Control Unit.
- check the fan for the Control Unit (only for CU310).

Note:
 The alarm automatically disappears after the limit value has been undershot.

Reaction upon N: NONE
 Acknowl. upon N: NONE

F01010	Drive type unknown
Message value:	%1
Drive object:	All objects
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	An unknown drive type was found. Fault value (r0949, interpret decimal): Drive object number (refer to p0101, p0107).
Remedy:	- Replace Power Module. - carry out a POWER ON (power off/on) for all components. - upgrade firmware to later version. - contact the Hotline.

F01011 (N)	Download interrupted
Message value:	-
Drive object:	All objects
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	The project download was interrupted. - the project download was prematurely ended by the user or by the commissioning software (e.g. STARTER, SCOUT). - the communication cable was interrupted (e.g. cable breakage, cable withdrawn). Note: The response to an interrupted download is the state "first commissioning".
Remedy:	- check the communication cable. - download the project again. - boot from previously saved files (power-down/power-up or p0976).
Reaction upon N:	NONE
Acknowl. upon N:	NONE

F01012 (N)	Project conversion error
Message value:	%1
Drive object:	VECTOR_G130/G150
Reaction:	OFF2 (NONE)
Acknowledge:	IMMEDIATELY
Cause:	When converting the project of an older firmware version, an error occurred. Fault value (r0949, interpret decimal): Parameter number of the parameter causing the error. For fault value = 600, the following applies: The temperature evaluation is no longer assigned to the power unit but to the encoder evaluation. Notice: Monitoring of the motor temperature is no longer ensured.
Remedy:	Check the parameter indicated in the fault value and correctly adjust it accordingly. Re fault value = 600: Parameter p0600 must be set to the values 1, 2 or 3 in accordance with the assignment of the internal encoder evaluation to the encoder interface. Value 1 means: The internal encoder evaluation is assigned to the encoder interface 1 via p0187. Value 2 means: The internal encoder evaluation is assigned to the encoder interface 2 via p0188. Value 3 means: The internal encoder evaluation is assigned to the encoder interface 3 via p0189. - If necessary, the internal encoder evaluation must be assigned to an encoder interface via parameters p0187, p0188 or p0189 accordingly. - If necessary, upgrade the firmware to a later version.

F01015	Internal software error
Message value:	%1
Drive object:	All objects
Reaction:	OFF2
Acknowledge:	POWER ON
Cause:	An internal software error has occurred. Fault value (r0949, interpret decimal): Only for internal Siemens troubleshooting.
Remedy:	- carry out a POWER ON (power off/on) for all components. - upgrade firmware to later version. - contact the Hotline.
A01016 (F)	Firmware changed
Message value:	%1
Drive object:	All objects
Reaction:	NONE
Acknowledge:	NONE
Cause:	At least one firmware file in the directory /SIEMENS/SINAMICS/ has been changed without authorization with respect to the version shipped from the factory. No changes are permitted in this directory. Alarm value (r2124, interpret decimal): 0: Checksum of one file is incorrect. 1: File missing. 2: Too many files. 3: Incorrect firmware version. 4: Incorrect checksum of the back-up file. See also: r9925 (Firmware file incorrect)
Remedy:	For the non-volatile memory for the firmware (memory card/device memory), restore the delivery condition. Note: The file involved can be read out using parameter r9925. See also: r9926 (Firmware check status)
Reaction upon F:	OFF2
Acknowled. upon F:	POWER ON
A01017	Component lists changed
Message value:	%1
Drive object:	All objects
Reaction:	NONE
Acknowledge:	NONE
Cause:	On the memory card, one file in the directory /SIEMENS/SINAMICS/DATA or /ADDON/SINAMICS/DATA has been illegally changed with respect to that supplied from the factory. No changes are permitted in this directory. Alarm value (r2124, interpret decimal): The problem is indicated in the first digit of the alarm value: 1. File does not exist. 2. Firmware version of the file does not match the software version. 3. The file checksum is incorrect. The second digit of the alarm value indicates in which directory the file is located: 0: Directory /SIEMENS/SINAMICS/DATA/ 1. Directory /ADDON/SINAMICS/DATA/ The third digit of the alarm value indicates the file: 0: File MOTARM.ACX 1: File MOTSRM.ACX 2: File MOTSLM.ACX 3: File ENCDATA.ACX 4: File FILTDATA.ACX 5: File BRKDATA.ACX 6: File DAT_BEAR.ACX 7: File CFG_BEAR.ACX 8: File ENC_GEAR.ACX
Remedy:	For the memory card file involved, restore the status originally supplied from the factory.

F01023 Software timeout (internal)

Message value: %1
Drive object: All objects
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: An internal software timeout has occurred.
Fault value (r0949, interpret decimal):
Only for internal Siemens troubleshooting.
Remedy: - carry out a POWER ON (power off/on) for all components.
- upgrade firmware to later version.
- contact the Hotline.

F01030 Sign-of-life failure for master control

Message value: -
Drive object: ENCODER, VECTOR_G130/G150
Reaction: OFF3 (ENCODER, IASC/DCBRAKE, NONE, OFF1, OFF2, STOP1, STOP2)
Acknowledge: IMMEDIATELY
Cause: For active PC master control, no sign-of-life was received within the monitoring time.
The master control was returned to the active BICO interconnection.
Remedy: Set the monitoring time higher at the PC or, if required, completely disable the monitoring function.
For the commissioning software, the monitoring time is set as follows:
<Drive> -> Commissioning -> Control panel -> Button "Fetch master control" -> A window is displayed to set the monitoring time in milliseconds.
Notice:
The monitoring time should be set as short as possible. A long monitoring time means a late response when the communication fails!

F01031 Sign-of-life failure for OFF in REMOTE

Message value: -
Drive object: VECTOR_G130/G150
Reaction: OFF3 (ENCODER, IASC/DCBRAKE, NONE, OFF1, OFF2, STOP1, STOP2)
Acknowledge: IMMEDIATELY
Cause: With the "OFF in REMOTE" mode active, no sign-of-life was received within 3 seconds.
Remedy: - Check the data cable connection at the serial interface for the Control Unit (CU) and operator panel.
- Check the data cable between the Control Unit and operator panel.

F01033 Units changeover: Reference parameter value invalid

Message value: Parameter: %1
Drive object: ENCODER, VECTOR_G130/G150
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: When changing over the units to the referred representation type, it is not permissible for any of the required reference parameters to be equal to 0.0
Fault value (r0949, parameter):
Reference parameter whose value is 0.0.
See also: p0349 (System of units, motor equivalent circuit diagram data), p0505 (Selecting the system of units), p0595 (Selecting technological units)
Remedy: Set the value of the reference parameter to a number different than 0.0.

F01034	Units changeover: Calculation parameter values after reference value change unsuccessful
Message value:	Parameter: %1
Drive object:	ENCODER, VECTOR_G130/G150
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	The change of a reference parameter meant that for an involved parameter the selected value was not able to be recalculated in the per unit representation. The change was rejected and the original parameter value restored. Fault value (r0949, parameter): Parameter whose value was not able to be recalculated. See also: p0304, p0305, p0310, p0596, p2000, p2001, p2002, p2003, r2004
Remedy:	Select the value of the reference parameter such that the parameter involved can be calculated in the per unit representation. See also: p0304, p0305, p0310, p0596, p2000, p2001, p2002, p2003, r2004
A01035 (F)	ACX: Boot from the back-up parameter back-up files
Message value:	%1
Drive object:	All objects
Reaction:	NONE
Acknowledge:	NONE
Cause:	When the Control Unit is booted, no complete data set was found from the parameter back-up files. The last time that the parameterization was saved, it was not completely carried out. Instead, a back-up data set or a back-up parameter back-up file is downloaded. Alarm value (r2124, interpret hexadecimal): Only for internal Siemens troubleshooting.
Remedy:	If you have saved the project using the commissioning software, carry out a new download for your project. Save using the function "Copy RAM to ROM" or with p0977 = 1 so that all of the parameter files are again completely written to the non-volatile memory.
Reaction upon F:	NONE (OFF1, OFF2, OFF3)
Acknowl. upon F:	IMMEDIATELY
F01036 (A)	ACX: Parameter back-up file missing
Message value:	%1
Drive object:	All objects
Reaction:	NONE (OFF1, OFF2, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	When downloading the device parameterization, a parameter back-up file associated with a drive object cannot be found. Neither a PSxxxxyy.ACX, a PSxxxxyy.NEW nor a PSxxxxyy.BAK parameter back-up file exists in the non-volatile memory for this drive object. Fault value (r0949, interpret hexadecimal): Byte 1: yyy in the file name PSxxxxyy.ACX yyy = 000 --> consistency back-up file yyy = 001 ... 062 --> drive object number yyy = 099 --> PROFIBUS parameter back-up file Byte 2, 3, 4: Only for internal Siemens troubleshooting.
Remedy:	If you have saved the project data using the commissioning software, carry out a new download for your project. Save using the function "Copy RAM to ROM" or with p0977 = 1 so that all of the parameter files are again completely written to the non-volatile memory. If you have not saved the project data, then first commissioning of the system has to be carried out again.

Acknowl. upon A:	NONE

F01037 (A)	ACX: Re-naming the parameter back-up file unsuccessful
Message value:	%1
Drive object:	All objects
Reaction:	NONE (OFF1, OFF2, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	Re-naming after saving a parameter back-up file in the non-volatile memory was unsuccessful. One of the parameter back-up files to be re-named had the "read only" attribute. The parameter back-up files are saved in the directory \USER\SINAMICS\DATA. It is possible that the non-volatile memory is defective. Fault value (r0949, interpret hexadecimal): Byte 1: yyy in the file names PSxxxxyy.* or Cxxxxyy.* or CCxxxxyy.* yyy = 000 --> consistency back-up file yyy = 099 --> PROFIBUS parameter back-up file PSxxx099.* Byte 2: xxx in the file name PSxxxxyy.* xxx = 000 --> data save started with p0977 = 1 xxx = 010 --> data save started with p0977 = 10 xxx = 011 --> data save started with p0977 = 11 xxx = 012 --> data save started with p0977 = 12 Byte 4, 3: Only for internal Siemens troubleshooting.
Remedy:	- check whether one of the files to be overwritten has the attribute "read only" and change this file attribute to "writable". Check all of the files (PSxxxxyy.*, CCxxxxyy.*, Cxxxxyy.*) that belong to drive yyy designated in the fault value. - replace the memory card or Control Unit.

F01038 (A)	ACX: Loading the parameter back-up file unsuccessful
Message value:	%1
Drive object:	All objects
Reaction:	NONE (OFF1, OFF2, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	An error has occurred when downloading PSxxxxyy.ACX or PTxxxxyy.ACX files from the non-volatile memory. Fault value (r0949, interpret hexadecimal): Byte 1: yyy in the file name PSxxxxyy.ACX yyy = 000 --> consistency back-up file yyy = 001 ... 062 --> drive object number yyy = 099 --> PROFIBUS parameter back-up file Byte 4, 3, 2: Only for internal Siemens troubleshooting.
Remedy:	- If you have saved the project data using the commissioning software, carry out a new download for your project. F01039 (A)	ACX: Writing to the parameter back-up file was unsuccessful
Message value:	%1
Drive object:	All objects
Reaction:	NONE (OFF1, OFF2, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	Writing to at least one parameter back-up file PSxxxxxyy.*** in the non-volatile memory was unsuccessful. - In the directory /USER/SINAMICS/DATA/ at least one parameter back-up file PSxxxxxyy.*** has the "read only" file attribute and cannot be overwritten. - There is not sufficient free memory space available. - The non-volatile memory is defective and cannot be written to. Fault value (r0949, interpret hexadecimal): dcba hex a = yyy in the file names PSxxxxxyy.*** a = 000 --> consistency back-up file a = 001 ... 062 --> drive object number a = 070 --> FEPROM.BIN a = 080 --> DEL4BOOT.TXT a = 099 --> PROFIBUS parameter back-up file b = xxx in the file names PSxxxxxyy.*** b = 000 --> data save started with p0977 = 1 b = 010 --> data save started with p0977 = 10 b = 011 --> data save started with p0977 = 11 b = 012 --> data save started with p0977 = 12 d, c: Only for internal Siemens troubleshooting.
Remedy:	- check the file attribute of the files (PSxxxxxyy.***, CAxxxxxyy.***, CCxxxxxyy.***) and, if required, change from "read only" to "writeable". - check the free memory space in the non-volatile memory. Approx. 80 kbyte of free memory space is required for every drive object in the system. - replace the memory card or Control Unit.

F01040	Save parameter settings and carry out a POWER ON
Message value:	-
Drive object:	All objects
Reaction:	OFF2
Acknowledge:	POWER ON
Cause:	A parameter was changed in the drive system which means that it is necessary to save the parameters and re-boot (e.g. p0110).
Remedy:	- save the parameters (p0971/p0977). - carry out a POWER ON (power off/on) for all components.
F01041	Parameter save necessary
Message value:	%1
Drive object:	All objects
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	Defective or missing files were detected on the memory card when booting. Fault value (r0949, interpret decimal): 1: Source file cannot be opened. 2: Source file cannot be read. 3: Target directory cannot be set up. 4: Target file cannot be set up/opened. 5: Target file cannot be written to. Additional values: Only for internal Siemens troubleshooting.

- Remedy:**
- save the parameters.
 - download the project again to the drive unit.
 - update the firmware
 - if required, replace the Control Unit and/or memory card card.

F01042 Parameter error during project download

Message value: Parameter: %1, Index: %2, fault cause: %3

Drive object: All objects

Reaction: OFF2 (NONE, OFF1, OFF3)

Acknowledge: IMMEDIATELY

Cause: An error was detected when downloading a project using the commissioning software (e.g. incorrect parameter value).
 For the specified parameter, it was detected that dynamic limits were exceeded that may possibly depend on other parameters.
 Fault value (r0949, interpret hexadecimal):
 ccbbaaaa hex
 aaaa = Parameter
 bb = Index
 cc = fault cause
 0: Parameter number illegal.
 1: Parameter value cannot be changed.
 2: Lower or upper value limit exceeded.

 126: Write access only in the commissioning state, device ready (device: p0009 = 0).
 127: Write access only in the commissioning state, device (device: p0009 not equal to 0).
 129: Parameter may not be written in download.
 130: Transfer of the master control is inhibited via BI: p0806.

131: Required BICO interconnection not possible because BICO output does not supply floating value
 132: Free BICO interconnection inhibited via p0922.
 133: Access method not defined.
 200: Below the valid values.
 201: Above the valid values.
 202: Cannot be accessed from the Basic Operator Panel (BOP).
 203: Cannot be read from the Basic Operator Panel (BOP).
 204: Write access not permitted.

Remedy:

- enter the correct value in the specified parameter.
- identify the parameter that restricts the limits of the specified parameter.

F01043 Fatal error at project download

Message value: Fault cause: %1
Drive object: All objects
Reaction: OFF2 (OFF1, OFF3)
Acknowledge: IMMEDIATELY
Cause: A fatal error was detected when downloading a project using the commissioning software.
 Fault value (r0949, interpret decimal):
 1: Device status cannot be changed to Device Download (drive object ON?).
 2: Incorrect drive object number.
 3: A drive object that has already been deleted is deleted again.
 4: Deleting of a drive object that has already been registered for generation.
 5: Deleting a drive object that does not exist.
 6: Generating an undeleted drive object that already existed.
 7: Regenerating a drive object already registered for generation.
 8: Maximum number of drive objects that can be generated exceeded.
 9: Error while generating a device drive object.
 10: Error while generating target topology parameters (p9902 and p9903).
 11: Error while generating a drive object (global component).
 12: Error while generating a drive object (drive component).
 13: Unknown drive object type.
 14: Drive status cannot be changed to "ready for operation" (p0947 and p0949).
 15: Drive status cannot be changed to drive download.
 16: Device status cannot be changed to "ready for operation".
 17: It is not possible to download the topology. The component wiring should be checked, taking into account the various messages/signals.
 18: A new download is only possible if the factory settings are restored for the drive unit.
 19: The slot for the option module has been configured several times (e.g. CAN and COMM BOARD)
 20: The configuration is inconsistent (e.g. CAN for Control Unit, however no CAN configured for drive objects A_INF, SERVO or VECTOR).

Remedy:

- use the current version of the commissioning software.
- modify the offline project and carry out a new download (e.g. compare the number of drive objects, motor, encoder, power unit in the offline project and at the drive).
- change the drive state (is a drive rotating or is there a message/signal?).
- carefully note any other messages/signals and remove their cause.

F01044 CU: Descriptive data error

Message value: %1
Drive object: All objects
Reaction: OFF2
Acknowledge: POWER ON
Cause: An error was detected when loading the descriptive data saved in the non-volatile memory.
Remedy: Replace the memory card or Control Unit.

A01045	CU: Configuring data invalid
Message value:	%1
Drive object:	All objects
Reaction:	NONE
Acknowledge:	NONE
Cause:	An error was detected when evaluating the parameter files PSxxxxxyy.ACX, PTxxxxyy.ACX, CAxxxxyy.ACX, or CCxxxxyy.ACX saved in the non-volatile memory. Alarm value (r2124, interpret hexadecimal): Only for internal Siemens troubleshooting.
Remedy:	Restore the factory setting using (p0976 = 1) and re-load the project to the drive unit. Operation without any restrictions is then possible. After downloading the project, save the parameters in STARTER using "Copy RAM to ROM" or with p0977 = 1. This overwrites the incorrect parameter files in the non-volatile memory.

A01049	CU: It is not possible to write to file
Message value:	%1
Drive object:	All objects
Reaction:	NONE
Acknowledge:	NONE
Cause:	It is not possible to write into a write-protected file (PSxxxxxx.acx). The write request was interrupted. Alarm value (r2124, interpret decimal): Drive object number.
Remedy:	Check whether the "write protected" attribute has been set for the files in the non-volatile memory under .../USER/SINAMICS/DATA/... When required, remove write protection and save again (e.g. set p0977 to 1).

F01050	Memory card and device incompatible
Message value:	-
Drive object:	All objects
Reaction:	OFF2 (NONE, OFF1, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	The memory card and the device type do not match (e.g. a memory card for SINAMICS S is inserted in SINAMICS G).
Remedy:	- insert the matching memory card. - use the matching Control Unit or power unit.

F01054	CU: System limit exceeded
Message value:	%1
Drive object:	All objects
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	At least one system overload has been identified. Fault value (r0949, interpret decimal): 1: Computing time load too high (r9976[1]). 5: Peak load too high (r9976[5]). See also: r9976 (System utilization)
Remedy:	Re fault value = 1, 5: - check the sampling times and adjust if necessary (p0115). - deactivate the function module. - deactivate the drive object. - remove the drive object from the target topology.

A01064 (F)	CU: Internal error (CRC)
Message value:	-
Drive object:	All objects
Reaction:	NONE
Acknowledge:	NONE
Cause:	CRC error in the Control Unit program memory
Remedy:	- carry out a POWER ON (power off/on) for all components. - upgrade firmware to later version. - contact the Hotline.
Reaction upon F:	NONE (OFF1, OFF2, OFF3, STOP2)
Acknowled. upon F:	IMMEDIATELY (POWER ON)
A01065	Drive: Fault on non-active encoder
Message value:	-
Drive object:	VECTOR_G130/G150
Reaction:	NONE
Acknowledge:	NONE
Cause:	One or several non-active encoders indicate an error.
Remedy:	Remove the error for the non-active encoder.
F01068	CU: Data memory, memory overflow
Message value:	%1
Drive object:	All objects
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	A data memory area has been overloaded. Fault value (r0949, interpret binary): Bit 0 = 1: High-speed data memory 1 overloaded Bit 1 = 1: High-speed data memory 2 overloaded Bit 2 = 1: High-speed data memory 3 overloaded Bit 3 = 1: High-speed data memory 4 overloaded
Remedy:	- deactivate the function module. - deactivate the drive object. - remove the drive object from the target topology.
A01099	Tolerance window of time synchronization exited
Message value:	-
Drive object:	All objects
Reaction:	NONE
Acknowledge:	NONE
Cause:	The time master exited the selected tolerance window for time synchronization. See also: p3109 (RTC real time synchronization, tolerance window)
Remedy:	Select the re-synchronization interval so that the synchronization deviation between the time master and drive system lies within the tolerance window. See also: r3108 (RTC last synchronization deviation)
A01100	CU: Memory card withdrawn
Message value:	-
Drive object:	VECTOR_G130/G150
Reaction:	NONE
Acknowledge:	NONE
Cause:	The memory card (non-volatile memory) was withdrawn during operation. Notice: It is not permissible for the memory card to be withdrawn or inserted under voltage.

Remedy:

- power down the drive system.
- re-insert the memory card that was withdrawn - this card must match the drive system.
- power up the drive system again.

F01105 (A) CU: Insufficient memory

Message value: %1
Drive object: All objects
Reaction: OFF1

Message value: %1
Drive object: All objects
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: A data save in the non-volatile memory was not able to be successfully carried out.

- non-volatile memory is defective.
- insufficient space in the non-volatile memory.

Fault value (r0949, interpret decimal):
Only for internal Siemens troubleshooting.
Remedy:

- try to save again.
- replace the memory card or Control Unit.

F01110 CU: More than one SINAMICS G on one Control Unit

Message value: %1
Drive object: All objects
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: More than one SINAMICS G type power unit is being operated from the Control Unit.
Fault value (r0949, interpret decimal):
Number of the second drive with a SINAMICS G type power unit.
Remedy: Only one SINAMICS G drive type is permitted.

F01111 CU: Mixed operation of drive units illegal

Message value: %1
Drive object: All objects
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: Illegal operation of various drive units on one Control Unit:

- SINAMICS S together with SINAMICS G
- SINAMICS S together with SINAMICS S Value or Combi

Fault value (r0949, interpret decimal):
Number of the first drive object with a different power unit type.
Remedy: Only power units of one particular drive type may be operated with one Control Unit.

F01112 CU: Power unit not permissible

Message value: %1
Drive object: All objects
Reaction: NONE
Acknowledge: IMMEDIATELY
Cause: The connected power unit cannot be used together with this Control Unit.
 Fault value (r0949, interpret decimal):
 1: Power unit is not supported (e.g. PM240).
 2: DC/AC power unit connected to CU310 not permissible.
Remedy: Replace the power unit that is not permissible by a component that is permissible.

F01120 (A) Terminal initialization has failed

Acknowledge: IMMEDIATELY (POWER ON)

Cause: A time slice management error has occurred.
It is possible that the sampling times have been inadmissibly set.
Fault value (r0949, interpret hexadecimal):
998: Too many time slices occupied by OA (e.g. DCC)
999: Too many time slices occupied by the basic system
Too many different sampling times may have been set.
Further values for internal Siemens troubleshooting.

Remedy:

- check the sampling time setting (p0112, p0115, p4099).
- contact the Hotline.

F01221 CU: Bas clk cyc too low

Message value: %1

Drive object: All objects

Reaction: NONE

Acknowledge: IMMEDIATELY

Cause: The closed-loop control / monitoring cannot maintain the envisaged clock cycle.
The runtime of the closed-loop control/monitoring is too long for the particular clock cycle or the computing time remaining in the system is not sufficient for the closed-loop control/monitoring.
Fault value (r0949, interpret hexadecimal):
Only for internal Siemens troubleshooting.

Remedy: Increase the basic clock cycle of DRIVE-CLiQ communication.

Cause:	When changing a sampling time (p0115[0], p0799 or p4099), inconsistency between the clock cycles has been identified. Alarm value (r2124, interpret decimal): 1: Value, low minimum value. 2: Value, high maximum value. 3: Value not a multiple of 1.25 µs. 4: Value does not match clock-cycle synchronous PROFIBUS operation. 5: Value not a multiple of 125 µs. 6: Value not a multiple of 250 µs. 7: Value not a multiple of 375 µs. 8: Value not a multiple of 400 µs. 10: Special restriction of the drive object violated. 20: On a SERVO with a sampling time of 62.5 µs, more than two drive objects or one drive object of a type other than SERVO have been detected on the same DRIVE-CLiQ line (a maximum of two SERVO type drive objects are permitted). 21: Value can be a multiple of the current controller sampling time of a servo or vector drive in the system (e.g. for TB30, the values of all of the indices should be taken into account). 30: Value less than 31.25 µs. 31: Value less than 62.5 µs. 32: Value less than 125 µs. 40: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 125 µs. Further, none of the nodes has a sampling time of less than 125 µs. 41: A chassis unit was identified on the DRIVE-CLiQ line as a node. Further, the highest common denominator of the sampling times of all of the nodes connected to the line is less than 250 µs. 42: An Active Line Module was identified on the DRIVE-CLiQ line as a node. Further, the highest common denominator of the sampling times of all of the nodes connected to the line is less than 125 µs. 43: A Voltage Sensing Module (VSM) was identified on the DRIVE-CLiQ line as a node. Further, the highest common denominator of the sampling times of all of the nodes connected to the line is not equal to the current controller sampling time of the drive object of the VSM. 44: The highest common denominator of the sampling times of all of the components connected to the DRIVE-CLiQ line is not the same for all components of this drive object (e.g. there are components on different DRIVE-CLiQ lines on which different highest common denominators are generated). 52: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 31.25 µs. 54: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 62.5 µs. 56: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 125 µs. 58: Nodes have been identified on the DRIVE-CLiQ line whose highest common denominator of the sampling times is less than 250 µs. 99: Inconsistency of cross drive objects detected. 116: Recommended clock cycle in r0116[0...1]. General note: The topology rules should be noted when connecting up DRIVE-CLiQ (refer to the appropriate product documentation). The parameters of the sampling times can also be changed with automatic calculations. Example for highest common denominator: 125 µs, 125 µs, 62.5 µs --> 62.5 µs
Remedy:	- check the DRIVE-CLiQ cables. - set a valid sampling time. See also: p0115, p0799, p4099

F01340 Topology: Too many components on one line

Message value: Component number or connection number: %1, fault cause: %2
Drive object: All objects
Reaction: NONE

Cause: For the selected communications clock cycle, too many DRIVE-CLiQ components are connected to one line of the Control Unit.
Fault value (r0949, interpret hexadecimal):
xyy hex: x = fault cause, yy = component number or connection number.
1yy:
The communications clock cycle of the DRIVE-CLiQ connection on the CU is not sufficient for all read transfers.
2yy:
The communications clock cycle of the DRIVE-CLiQ connection on the CU is not sufficient for all write transfers.
3yy:
Cyclic communication is fully utilized.
4yy:
The DRIVE-CLiQ cycle starts before the earliest end of the application. An additional dead time must be added to the control. Sign-of-life errors can be expected.
5yy:
Internal buffer overflow for net data of a DRIVE-CLiQ connection.
6yy:

7yy:
Internal buffer overflow for send data of a DRIVE-CLiQ connection.
Remedy: Check the DRIVE-CLiQ connection:
Reduce the number of components on the DRIVE-CLiQ line involved and distribute these to other DRIVE-CLiQ connections of the Control Unit. This means that communication is uniformly distributed over several communication lines.
Re fault value = 1yy - 4yy in addition:

yyxx hex: yy = component number, xx = cause.
xx = 1: Component at this Control Unit not permissible.
xx = 2: Component in combination with another component not permissible.
Note:
Pulse enable is prevented.
Remedy: Remove the illegal components and restart the system.

F01355	Topology: Actual topology changed
Message value:	%1
Drive object:	All objects
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	The device target topology (p0099) does not correspond to the device actual topology (r0098). The fault only occurs if the topology was commissioned using the automatic internal device mechanism and not using the commissioning software. Fault value (r0949, interpret decimal): Only for internal Siemens troubleshooting. See also: r0098 (Actual device topology), p0099 (Device target topology)
Remedy:	One of the following counter-measures can be selected if no faults have occurred in the topology detection itself: If commissioning was still not completed: - carry out a self-commissioning routine (starting from p0009 = 1). General: Set p0099 to r0098, set p0009 to 0; for existing Motor Modules, this results in servo drives being automatically generated (p0107). Generating servo drives: Set p0097 to 1, set p0009 to 0. Generating vector drives: Set p0097 to 2, set p0009 to 0. Generating vector drives with parallel circuit: Set p0097 to 12, set p0009 to 0. In order to set configurations in p0108, before setting p0009 to 0, it is possible to first set p0009 to 2 and modify p0108. The index corresponds to the drive object (p0107). If commissioning was already completed: - re-establish the original connections and re-connect power to the Control Unit. - restore the factory setting for the complete equipment (all of the drives) and allow automatic self-commissioning again. - change the device parameterization to match the connections (this is only possible using the commissioning software). Notice: Topology changes that result in this fault being generated cannot be accepted by the automatic function in the device, but must be transferred using the commissioning software and parameter download. The automatic function in the device only allows constant topology to be used. Otherwise, when the topology is changed, all of the previous parameter settings are lost and replaced by the factory setting. See also: r0098 (Actual device topology)

A01362 Topology: Topology rule(s) broken

Message value: %1
Drive object: All objects
Reaction: NONE
Acknowledge: NONE
Cause: At least one topology rule for the SINAMICS S120 Combi has been broken.
In the event of a fault, the ramping up of the drive system is aborted and closed-loop drive control is not enabled.
Fault value (r0949, interpret decimal):
The fault value indicates which rule has been broken.
1: The S120 Combi may only be wired via DRIVE-CLiQ socket X200 to X1 on the NCU.
2: Only one Terminal Module 54F (TM54F) may be connected to DRIVE-CLiQ socket X2 on the NCU. If a TM54 is being used, it may only be wired via X500 to X2 on the NCU.
3: Only one DRIVE-CLiQ Hub Module (hub) may be connected to DRIVE-CLiQ socket X3 on the NCU. If a hub is being used, it may only be wired via X500 to X3 on the NCU.
4: Only Sensor Modules may be connected to DRIVE-CLiQ sockets X201 through X203 (3-axis) or X204 (4-axis) on the S120 Combi.
5: Only one Single Motor Module or one Double Motor Module may be connected to DRIVE-CLiQ socket X205 (X204 is not available for 3-axis). The module must be wired to the S120 Combi via X200.
6: Only certain Motor Modules may be used for expansion axes.
7: If a Single Motor Module is being used as the first expansion axis, only one more Single Motor Module may be connected (via X200 to X201 on the first Single Motor Module).
8: Only Sensor Modules may be connected to the corresponding DRIVE-CLiQ socket X202 on any Single Motor Modules which may be present.
9: On the second Single Motor Module there must be nothing connected to X201.
10: If a Double Motor Module is used as an expansion axis, only Sensor Modules may be connected to X202 and X203.
11: On the Double Motor Module there must be nothing connected to X201.
12: On the Terminal Module 54F (TM54F) there must be nothing connected to X501.
13: On the DRIVE-CLiQ Hub Module, only Sensor Modules Cabinet (SMC) and Sensor Modules External (SME) may be connected to X501 through X505.
Remedy: Evaluate the fault value and ensure compliance with the corresponding topology rule(s).

Cause:	One of the Safety Integrated monitoring clock cycles is not permissible: - the drive-based monitoring clock cycle cannot be maintained due to the communication conditions required in the system. - the monitoring clock cycle for safe motion monitoring functions with the higher-level control is not permissible (p9500). - The sampling time for the current controller (p0112, p0115) cannot be supported. Note: This fault results in a STOP A that cannot be acknowledged. Fault value (r0949, interpret decimal): - for enabled drive-based SI monitoring (p9601/p9801 > 0): Minimum setting for the monitoring clock cycle (in µs). - with the motion monitoring function enabled (p9501 > 0): 100: No matching monitoring clock cycle was able to be found. 101: The monitoring clock cycle is not an integer multiple of the actual value sensing clock cycle. 102: An error has occurred when transferring the DP clock cycle to the Motor Module (MM). 103: An error has occurred when transferring the DP clock cycle to the Sensor Module. 104,105: - four times the current controller sampling time is greater than 1 ms when operating with a non-isochronous PROFIBUS. - four times the current controller sampling time is greater than the DP clock cycle when operating with an isochronous PROFIBUS. - The DP clock cycle is not an integer multiple of the sampling time of the current controller. 106: The monitoring clock cycle does not match the monitoring clock cycle of the TM54F. 107: Four times the current controller sampling time is greater than the actual value sensing clock cycle (p9511) or the actual value sensing clock cycle is not an integer multiple of the current controller sampling time. 108: The parameterized actual value sensing clock cycle cannot be set on this component. 109: If the motion monitoring functions have been parameterized as encoderless (p9506), the actual value sensing clock cycle (p9511) and the current controller clock cycle must be identical. 110: The actual value sensing clock cycle (p9511) for safety with encoder (p9506 = 0) is less than 2 ms for this Control Unit (e.g. CU305).

Remedy:

For enabled drive-based SI monitoring (p9601/p9801 > 0):

- upgrade the Control Unit software.

For enabled motion monitoring function (p9501 > 0):

- correct the monitoring clock cycle (p9500) and carry out POWER ON.

Re fault value = 101:

- actual value sensing clock cycle corresponds to position control clock cycle/DP clock cycle (factory setting).
- for the drive-based motion monitoring functions (p9601/p9801bit 2 = 1) the actual value sensing clock cycle can be directly parameterized in P9511/p9311.

Re fault value = 104, 105:

- set a separate actual value sensing clock cycle in p9511.
- restrict operation to a maximum of two vector drives. For the standard setting in p0112, p0115, the current controller sampling time is automatically reduced to 250 µs. If the standard values were changed, then the current controller sampling time (p0112, p0115) should be appropriately set.
- increase the DP clock cycle for operation with a clock-cycle synchronous PROFIBUS so that there is a multiple clock cycle ratio of at least 4:1 between the DP clock cycle and the current controller sampling time. A clock cycle ratio of at least 8:1 is recommended.
- With firmware version 2.5, please ensure that parameter p9510 is set to 1 in the drive (clock cycle synchronous operation).

Re fault value = 106:

- set the parameters for the monitoring clock cycles the same (p10000 and p9500 / p9300).

Re fault value = 107:

- set an actual value sensing clock cycle in p9511 that matches the current controller clock cycle. A clock cycle ratio of at least 8:1 is recommended.

Re fault value = 108:

- set a suitable actual value sensing clock cycle in p9511.
- if the DP clock cycle is used as the actual value sensing clock cycle for operation with isochronous PROFIBUS (p9511 = 0), then a suitable DP clock cycle must be configured.

A suitable multiple of the DP clock cycle (e.g. 1, 2, 3, 4, 5, 6, 8, 10) must be parameterized on the D410. Otherwise, the clock cycle must be set to less than 8 ms.

Re fault value = 109:

- set the actual value sensing clock cycle in p9511 to the same value as the current controller clock cycle (p115).

Re fault value = 110:

- set the actual value sensing clock cycle in p9511 to 2 ms or higher.

Message value:	%1
Drive object:	VECTOR_G130/G150
Reaction:	NONE (OFF1, OFF2, OFF3)
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	There is a PROFIBUS configuration error for using Safety Integrated monitoring functions with a higher-level control (SINUMERIK or F-PLC).
	Note:
	For safety functions that have been enabled, this fault results in a STOP A that cannot be acknowledged.
	Fault value (r0949, interpret decimal):
	200: A safety slot for receive data from the control has not been configured.
	210, 220: The configured safety slot for the receive data from the control has an unknown format.
	230: The configured safety slot for the receive data from the F-PLC has the incorrect length.
	231: The configured safety slot for the receive data from the F-PLC has the incorrect length.
	240: The configured safety slot for the receive data from the SINUMERIK has the incorrect length.
	250: A PROFIsafe slot is configured in the higher-level F control, however PROFIsafe is not enabled in the drive.
	300: A safety slot for the send data to the control has not been configured.
	310, 320: The configured safety slot for the send data to the control has an unknown format.
	330: The configured safety slot for the send data to the F-PLC has the incorrect length.
	331: The configured safety slot for the send data to the F-PLC has the incorrect length.
	340: The configured safety slot for the send data to the SINUMERIK has the incorrect length.

Remedy: The following generally applies:

- check and, if necessary, correct the PROFIBUS configuration of the safety slot on the master side.
- upgrade the Control Unit software.

Re fault value = 250:

- remove the PROFIsafe configuring in the higher-level F control or enable PROFIsafe in the drive.

Re fault value = 231, 331:

- configure the PROFIsafe telegram matching the parameterization in the F-PLC.

The following applies for p9501.30 = 1 (FDI via PROFIsafe is enabled): PROFIsafe telegram 900 must be configured.

The following applies for p9501.30 = 0 (FDI via PROFIsafe not enabled): PROFIsafe telegram 30 must be configured.

This fault does not result in a safety stop response.
Fault value (r0949, interpret decimal):
0: There is no physical NVRAM available in the drive.
1: There is no longer any free memory space in the NVRAM.
Remedy: Re fault value = 0:
- use a Control Unit NVRAM.
Re fault value = 1:
- deselect functions that are not required and that take up memory space in the NVRAM.
- contact the Hotline.

A01691 (F) SI Motion: Ti and To unsuitable for DP cycle

Message value: -
Drive object: VECTOR_G130/G150
Reaction: NONE
Acknowledge: NONE
Cause: The configured times for PROFIBUS communication are not permitted and the DP cycle is used as the actual value acquisition cycle for the safe movement monitoring functions:
Isochronous PROFIBUS: the total of Ti and To is too high for the set DP cycle. The DP cycle should be at least 1 current controller cycle greater than the sum of Ti and To.
Non-isochronous PROFIBUS: the DP cycle must be at least 4 x current controller cycle.

Remedy: Configure Ti and To low so that they are suitable for the DP cycle or increase the DP cycle time.
Alternative when drive-based SI monitoring is enabled (p9601/p9801 > 0):
Use the actual value acquisition cycle p9511/p9311 and, in turn, set independently from DP cycle. The actual value sensing clock cycle must be at least four times the current controller clock cycle. A clock cycle ratio of at least 8:1 is recommended.

F01692 SI Motion CU: Parameter value not permitted for encoderless

Message value: Parameter: %1
Drive object: VECTOR_G130/G150
Reaction: OFF2
Acknowledge: IMMEDIATELY (POWER ON)
Cause: The parameter cannot be set to this value if encoderless motion monitoring functions have been selected in p9506.
Note:
This fault does not result in a safety stop response.
Fault value (r0949, interpret decimal):
Parameter number with the incorrect value.
See also: p9501 (SI Motion enable safety functions (Control Unit))

Remedy:
- Correct the parameter specified in the fault value.
- If necessary, deselect encoderless motion monitoring functions (p9506).

A01693 (F) SI Motion CU: Safety parameter setting changed, warn restart/POWER ON required

Message value: %1
Drive object: TM54F_MA, TM54F_SL, VECTOR_G130/G150
Reaction: NONE
Acknowledge: NONE
Cause: Safety parameters have been changed; these will only take effect following a warm restart or POWER ON.
Alarm value (r2124, interpret decimal):
Parameter number of the safety parameter which has changed, necessitating a warm restart or POWER ON.

Remedy:
- carry out a warm restart (p0971 = 3)
- carry out a POWER ON (power off/on) for all components.

A01696 (F) SI Motion: Testing of the motion monitoring functions selected when booting

Message value: -
Drive object: VECTOR_G130/G150
Reaction: NONE
Acknowledge: NONE
Cause: The test of the motion monitoring functions was already illegally active when booting.
This is the reason that the test is only carried out again after selecting the forced checking procedure parameterized in p9705.
Note:
This message does not result in a safety stop response.
See also: p9705 (SI Motion: Test stop signal source)

Remedy: Deselect the forced checking procedure of the safety motion monitoring functions and then select again.
The signal source for initiation is parameterized in binector input p9705.
Notice:
It is not permissible to use TM54F inputs to start the test stop.

C01700 SI Motion CU: STOP A initiated

Message value: -
Drive object: VECTOR_G130/G150
Reaction: OFF2
Acknowledge: IMMEDIATELY (POWER ON)
Cause: The drive is stopped via a STOP A (pulses are suppressed via the safety shutdown path of the Control Unit).
 Possible causes:
 - stop request from the second monitoring channel
 - pulses not suppressed after a parameterized time (p9557) after test stop selection.
 - subsequent response to the message C01706 "SI Motion CU: Safe Acceleration Monitoring limit exceeded".
 - subsequent response to the message C01714 "SI Motion CU: Safely-Limited Speed exceeded".
 - subsequent response to the message C01701 "SI Motion CU: STOP B initiated".
Remedy:
 - remove the cause of the fault on the second monitoring channel
 - carry out a diagnostics routine for message C01706.
 - carry out a diagnostics routine for message C01714.
 - carry out a diagnostics routine for message C01701.
 - check the value in p9557 (where available), increase the value if necessary, and carry out a POWER ON
 - check the shutdown path of the Control Unit (check DRIVE-CLiQ communication if it has been implemented)
 - replace the Motor Module/Power Module
 - replace Control Unit.
 This message can be acknowledged without a POWER ON as follows:

C01701 SI Motion CU: STOP B initiated

Message value: -
Drive object: VECTOR_G130/G150
Reaction: OFF3
Acknowledge: IMMEDIATELY (POWER ON)
Cause: The drive is stopped via a STOP B (braking along the OFF3 deceleration ramp).
 As a result of this fault, after the time parameterized in p9556 has expired, or the speed threshold parameterized in p9560 has been undershot, message C01700 "STOP A initiated" is output.
 Possible causes:
 - stop request from the second monitoring channel
 - subsequent response to the message C01714 "SI Motion: Safely reduced speed exceeded".
 - subsequent response to the message C01711 "SI Motion: Defect in a monitoring channel".
Remedy:
 - remove the cause of the fault on the second monitoring channel

C01711 SI Motion CU: Defect in a monitoring channel

Message value: %1

Drive object: VECTOR_G130/G150

Reaction: NONE

Acknowledge: IMMEDIATELY (POWER ON)

Cause:

When cross-checking and comparing the two monitoring channels, the drive detected a difference between the input data or results of the monitoring functions and initiated a STOP F. One of the monitoring functions no longer reliably functions - i.e. safe operation is no longer possible.

If at least one monitoring function is active, then after the parameterized timer has expired, the message C01701 "SI Motion: STOP B initiated" is output.

The message value that resulted in a STOP F is displayed in r9725. The described message values involve the data cross-check between the Control Unit and Motor Module. If the drive is operated together with a SINUMERIK, the message values are described in message 27001 of SINUMERIK.

The following message values may also occur in the following cases if the cause that is explicitly mentioned does not apply:

- cycle times not set uniformly (p9500/p9300 and p9511/p9311)
- differently parameterized axis types (p9502/p9302).
- excessively fast cycle times (p9500/p9300, p9511/p9311).
- for message values 3, 44 ... 57, 232, and encoder systems, differently parameterized encoder values (p9516/p9316, p9517/p9317, p9518/p9318, p9520/p9320, p9521/p9321, p9522/p9322, p9526/p9326).
- incorrect synchronization.

Message value (r9749, interpret decimal):

0 to 999: Number of the cross-checked data that resulted in this fault.

Message values that are not subsequently listed are only for internal Siemens troubleshooting.

0: Stop request from the other monitoring channel.

1: Status image of monitoring functions SOS, SLS or SLP (result list 1) (r9710[0], r9710[1]).

2: Status image of monitoring function SCA or n < nx (result list 2) (r9711[0], r9711[1]).

3: The position actual value differential (r9713) between the two monitoring channels is greater than the tolerance in p9542/p9342. When actual value synchronization is enabled (p9501.3/p9301.3), the velocity differential (based on the position actual value) is greater than the tolerance in p9549/p9349.

4: Error when synchronizing the crosswise data comparison between the two channels.

5: Function enable signals (p9501/p9301)

6: Limit value for SLS1 (p9531[0]/p9331[0])

7: Limit value for SLS2 (p9531[1]/p9331[1])

8: Limit value for SLS3 (p9531[2]/p9331[2])

9: Limit value for SLS4 (p9531[3]/p9331[3])

10: Standstill tol. (p9530/p9330)

31: Position tolerance (p9542/p9342) or (p9549/p9349) when actual value synchronization is enabled (p9501.3/p9301.3)

33: Time, velocity changeover (p9551/p9351)

35: Delay time, pulse canc. (p9556/p9356)

36: Checking time, pulse canc. (p9557/p9357)

37: Trans. time, STOP C to SOS (p9552/p9352)

38: Trans. time STOP D to SOS (p9553/p9353)

40: Stop response for SLS (p9561/p9361)

42: Shutdown speed, pulse canc. (p9560/p9360)

43: Memory test, stop response (STOP A).

44 ... 57: General

Possible cause 1 (during commissioning or parameter modification)

The tolerance value for the monitoring function is not the same on the two monitoring channels.

Possible cause 2 (during active operation)

The limit values are based on the current actual value (r9713). If the safe actual values on the two monitoring channels do not match, the limit values, which have been set at a defined interval, will also be different (i.e. corresponding to fault value 3). This can be ascertained by checking the safe actual positions.

44: Position actual value (r9713) + limit value for SLS1 (p9531[0]/p9331[0])

45: Position actual value (r9713) - limit value for SLS1 (p9531[0]/p9331[0])

46: Position actual value (r9713) + limit value for SLS2 (p9531[1]/p9331[1])

47: Position actual value (r9713) - limit value for SLS2 (p9531[1]/p9331[1])

48: Position actual value (r9713) + limit value for SLS3 (p9531[2]/p9331[2])

49: Position actual value (r9713) - limit value for SLS3 (p9531[2]/p9331[2])

50: Position actual value (r9713) + limit value for SLS4 (p9531[3]/p9331[3])

Remedy:

The following generally applies:
The monitoring clock cycles in both channels and the axis types should be checked for equality and the same setting applied if necessary. If the error continues to be identified, increasing the monitoring clock cycles may resolve it.
Re fault value = 0:
- no error was identified in this monitoring channel. Note the error message of the other monitoring channel (for MM: C30711).
Re fault value = 3:
Commissioning phase:
Encoder evaluation for own or second channel has been set incorrectly --> Correct the encoder evaluation.
In operation:
Check the mechanical design and the encoder signals.
Re fault value = 4:
The monitoring clock cycles in both channels should be checked for equality and if required, set the same. In combination with fault value 5 from the other monitoring channel (with MM: C30711), the monitoring clock cycle settings must be increased.
Re fault value = 1 ... 999:
- if the fault value is listed under cause: Check the crosswise-compared parameters to which the fault value refers.
- copy the safety parameters.
- carry out a POWER ON (power off/on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.
- correction of the encoder evaluation. The actual values differ as a result of mechanical faults (V belts, travel to a mechanical endstop, wear and window setting that is too narrow, encoder fault, ...).
Re fault value = 1000:
- investigate the signal associated with the safety-relevant input (contact problems).
Re fault value = 1001:
- carry out a POWER ON (power off/on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.
Re fault value = 1005:
- check the conditions for pulse enable.
Re fault value = 1011:
- for diagnostics, refer to parameter (r9571).
Re fault value = 1012:
- upgrade the Sensor Module software.
- check the encoder parameters in the encoder systems for equality (p9515/p9315, p9519/p9319, p9523/p9323, p9524/p9324, p9525/p9325, p9529/p9329).
Re fault value = 1020, 1021:
- check the communication link.
- increase the monitoring cycle clock settings (p9500, p9511).
- carry out a POWER ON (power off/on) for all components.
- replace the hardware.

Cause: The bus is in the data exchange state and clock synchronous operation has been selected using the parameterizing telegram. Synchronization with the master sign-of-life (STW2.12 ... STW2.15) could not be completed because the sign-of-life is changing differently to how it was configured in the Tmapc time grid.

Remedy:

- ensure that the master correctly increments the sign-of-life in the master application clock cycle Tmapc.
- correct the interconnection of the master sign-of-life (p2045).

F01951	CU DRIVE-CLiQ: Synchronization application clock cycle missing
Message value:	%1
Drive object:	All objects
Reaction:	OFF2 (NONE)
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	If DRIVE-CLiQ components with different application clock cycle are operated on a DRIVE-CLiQ port, this requires synchronization with the Control Unit. This synchronization routine was unsuccessful. Fault value (r0949, interpret decimal): Only for internal Siemens troubleshooting.
Remedy:	- carry out a POWER ON (power off/on) for all components. - upgrade the software of the DRIVE-CLiQ components. - upgrade the Control Unit software.

Reaction:	OFF2 (NONE)
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	The existing system configuration requires that the connected DRIVE-CLiQ components support the synchronization between the basic clock cycle, DRIVE-CLiQ clock cycle and the application clock cycle. However, not all DRIVE-CLiQ components have this functionality. Fault value (r0949, interpret decimal): Component number of the first faulty DRIVE-CLiQ component.
Remedy:	Upgrade the firmware of the component specified in the fault value. Note: If required, also upgrade additional components in the DRIVE-CLiQ line.

A02041 Function generator: Illegal value for bandwidth

Message value: -
Drive object: All objects
Reaction: NONE
Acknowledge: NONE
Cause: The bandwidth referred to the time slice clock cycle of the function generator has either been set too low or too high.
 Depending on the time slice clock cycle, the bandwidth is defined as follows:
 $\text{Bandwidth_max} = 1 / (2 * \text{time slice clock cycle})$
 $\text{Bandwidth_min} = \text{Bandwidth_max} / 100000$
 Example:
 Assumption: p4830 = 125 µs
 --> $\text{Bandwidth_max} = 1 / (2 * 125 \text{ µs}) = 4000 \text{ Hz}$
 --> $\text{Bandwidth_min} = 4000 \text{ Hz} / 100000 = 0.04 \text{ Hz}$
Note:
 p4823: Function generator bandwidth

This fault can only occur if p4056[x] = 3 (4 ... 20 mA with monitoring) is set. Index x = 0: Analog input 0 (X522.1 to .3) Index x = 1: Analog input 1 (X522.4 to .5) Fault value (r0949, interpret decimal): The component number (p0151) of the module involved is specified at the units, tens and hundreds digit. The thousands digit specifies the analog input involved: 0: Analog input 0 (AI 0), 1: Analog input 1 (AI 1). The leading zero of analog input 0 (AI 0) is masked out of the fault value.
Remedy:	Check the connection to the signal source for interruptions. Check the magnitude of the injected current - it is possible that the infed signal is too low. Please note that the input has a load resistance of 250 Ohm. The input current measured by the Terminal Module can be read out from r4052[x].

F07085 Drive: Open-loop/closed-loop control parameters changed

Message value: Parameter: %1

Drive object: VECTOR_G130/G150

Reaction: NONE

Acknowledge: IMMEDIATELY (POWER ON)

Cause: Open-loop/closed-loop control parameters have had to be changed because:
1) They have exceeded dynamic limits because of other parameters, or
2) They cannot be used due to the hardware detected not having certain properties.

Fault value (r0949, interpret decimal):

The fault value includes the modified parameter number.

340: The motor and control parameters were automatically calculated (p0340 = 1), because the vector control was subsequently activated as configuration (r0108.2).

See also: p0640 (Current limit), p1082 (Maximum speed), p1300 (Open-loop/closed-loop control operating mode), p1800 (Pulse frequency setpoint)

Remedy: It is not necessary to change the parameters as they have already been correctly limited.

F07086 Units changeover: Parameter limit violation due to reference value change

Message value: Parameter: %1

Drive object: ENCODER, VECTOR_G130/G150

Reaction: NONE

Acknowledge: IMMEDIATELY

Cause: A reference parameter was changed in the system. This resulted in the fact that for the parameters involved, the selected value was not able to be written in the per unit representation (cause: e.g. the steady-state minimum/maximum limit or that defined in the application was violated). The values of the parameters were set to the corresponding violated minimum/maximum limit or to the factory setting.

Fault value (r0949, parameter):

Diagnostics parameter r9450 to display the parameters that were not able to be recalculated.

See also: p0304, p0305, p0310, p0596, p2000, p2001, p2002, p2003, r2004

Remedy: Check the adapted parameter value and if required correct.
See also: r9450 (Reference value change parameter with unsuccessful calculation)

F07088 Units changeover: Parameter limit violation due to units changeover

Message value: Parameter: %1

Drive object: ENCODER, VECTOR_G130/G150

Reaction: NONE

Acknowledge: IMMEDIATELY

Cause: A changeover of units was initiated.

Possible causes for the violation of a parameter limit are:

- when rounding off a parameter corresponding to its decimal places, the steady-state minimum or maximum limit was violated.

- inaccuracies for the data type "Floating Point".

In these cases, when the minimum limit is violated then the parameter value is rounded up and when the maximum limited is violated the parameter value is rounded down.

Fault value (r0949, interpret decimal):

Diagnostics parameter r9451 to display all parameters whose value had to be adapted.

See also: p0100 (IEC/NEMA mot stds), p0349 (System of units, motor equivalent circuit diagram data), p0505 (Selecting the system of units), p0595 (Selecting technological units)

Remedy: Check the adapted parameter values and if required correct.

F07320 Drive: Automatic restart interrupted

Message value: %1

Drive object: VECTOR_G130/G150

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause:

- The specified number of restart attempts (p1211) has been completely used up because within the monitoring time (p1213) the faults were not able to be acknowledged. The number of restart attempts (p1211) is decremented at each new start attempt.
- there is no active ON command.
- the monitoring time for the power unit has expired (p0857).
- when exiting commissioning or at the end of the motor identification routine or the speed controller optimization, the drive unit is not automatically powered up again.

Fault value (r0949, interpret hexadecimal):
Only for internal Siemens troubleshooting.

Remedy:

- increase the number of restart attempts (p1211). The actual number of starting attempts is displayed in r1214.
- increase the delay time in p1212 and/or the monitoring time in p1213.
- issue an ON command (p0840).
- either increase or disable the monitoring time of the power unit (p0857).
- Reduce the waiting time for resetting the fault counter p1213[1] so that fewer faults are registered in the time interval.

Cause:	The DC link voltage controller has been activated because the upper switch-in threshold has been exceeded (r1242, r1282). The ramp-down times are automatically increased in order to maintain the DC link voltage (r0070) within the permissible limits. There is a system deviation between the setpoint and actual speeds. When the DC link voltage controller is switched out (disabled), this is the reason that the ramp-function generator output is set to the speed actual value. See also: p1240 (Vdc controller or Vdc monitoring configuration), p1280 (Vdc controller or Vdc monitoring configuration (V/f))

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: When quick magnetizing is configured (p1401.6 = 1) the specified flux setpoint is not reached although 90% of the maximum current is specified.

- incorrect motor data.
- motor data and motor configuration (star-delta) do not match.
- the current limit has been set too low for the motor.
- induction motor (encoderless, open-loop controlled) in I2t limiting.
- the Motor Module is too small.
- the magnetizing time p0346 is too short.

Remedy:

- correct the motor data. Perform motor data identification and rotating measurement.

F07412 Drive: Commutation angle incorrect (motor model)

Message value: -

Drive object: VECTOR_G130/G150

Reaction: ENCODER (NONE, OFF2)

Acknowledge: IMMEDIATELY

Cause: An incorrect commutation angle was detected that can result in a positive coupling in the speed controller.

Possible causes:

- the motor encoder is incorrectly adjusted with respect to the magnet position.
- the motor encoder is damaged.
- the angular commutation offset is incorrectly set (p0431).
- data to calculate the motor model has been incorrectly set (p0356 (motor-stator leakage inductance) and/or p0350 (motor-stator resistance) and/or p0352 (cable resistance)).
- the changeover speed for the motor model is too low (p1752). The monitoring function only becomes effective above the changeover speed.
- pole position identification might have calculated an incorrect value when activated (p1982 = 1).
- the motor encoder speed signal is faulted.
- the control loop is instable due to incorrect parameterization.

Fault value (r0949, interpret decimal):

SERVO:

0: The comparison of the pole position angle from the encoder and the motor model resulted in an excessively high value (> 80 ° electrical).

1: -

VECTOR:

0: The comparison of the pole position angle from the encoder and the motor model resulted in an excessively high value (> 45 ° electrical).

1: The change in the speed signal from the motor encoder has changed by > p0492 within a current controller clock cycle.

- Remedy:**
- if the encoder mounting was changed - re-adjust the encoder.
 - replace the defective motor encoder.
 - correctly set the angular commutation offset (p0431).
 - correctly set the motor stator resistance, cable resistance and motor-stator leakage inductance (p0350, p0352, p0356).
 - increase the changeover speed for the motor model (p1752). The monitoring is completely deactivated for p1752 > p1082 (maximum speed).
 - with pole position identification activated (p1982 = 1) check the procedure for pole position identification (p1980) and force a new pole position identification procedure by means of deselection followed by selection (p1982 = 0 -> 1).
- Note:
For High Dynamic Motors (1FK7xxx-7xxx), for applications with a higher current, if necessary, the monitoring should be disabled.

F07417	Drive: Pulse technique not plausible (motor model)
Message value:	%1
Drive object:	VECTOR_G130/G150
Reaction:	OFF2 (NONE)
Acknowledge:	IMMEDIATELY
Cause:	The evaluation of the test pulse response found incorrect values. Fault value (r0949, interpret decimal): Fault value 0: An impermissible pulse technique configuration was detected during ramp-up. Possible causes: - The pulse technique was initially selected during system ramp-up (p1750.5=1) but the power unit component does not support the current oversampling required (see r192.23). As a consequence, p1750.0 was deselected automatically. Fault value 10: The pulse response is repeatedly implausible. Possible causes: - Incorrect configuration of the power unit component - The power unit component is faulty. Fault value 20: At the preset pulse amplitude the measured pulse response is much higher than the expected value. Possible causes: - The orientation loop has been affected by major vibration phenomena. - The motor is short-circuited for high frequencies (output filter). - The motor is damaged.
Remedy:	Re fault value 0: Once the pulse technique has been deselected automatically (p1750.5=0), there are two possible options: - acknowledge the fault and save parameter p1750.5=0 => field-oriented control mode to standstill is forfeited and replaced by transition to open-loop control at low speeds. - replace the power unit firmware (at least V4.30) => field-oriented control mode to standstill is available. Re fault value 10: With active selection of the pulse technique (p1750.5) - power both the CU and the power unit component down and then back up again, or - perform a manual warm restart (see P0009, P0976). If this does not solve the problem: Replace the power unit component. Re fault value 20: - control parameters might have been adjusted (factory setting, commissioning). - filters must not be connected between motor and converter/inverter. - check the motor.

Cause: A drive data set was selected - with the pulses enabled - which has a different parameterized direction of rotation (p1821).

It is only possible to change the motor direction of rotation using p1821 when the pulses are inhibited.

Remedy:

- change over the drive data set with the pulses inhibited.
- ensure that the changeover to a drive data set does not result in the motor direction of rotation being changed (i.e. for these drive data sets, the same value must be in p1821).

F07435 (N) Drive: Setting the ramp-function generator for encoderless vector control

Message value: Parameter: %1

Drive object: VECTOR_G130/G150

Reaction: OFF2 (IASC/DCBRAKE, NONE, OFF1, OFF3)

Acknowledge: IMMEDIATELY

Cause: During operation with encoderless vector control (r1407.1) the ramp-function generator was stopped (p1141) or bypassed (p1122). An internal setting command of the ramp-function generator output caused the set setpoint speed to be frozen or was not able to be realized.

Remedy:

- deactivate the holding command for the ramp-function generator (p1141).
- do not bypass the ramp-function generator (p1122).
- suppress the fault (p2101, p2119). This is necessary if the ramp-function generator is held using jogging and the speed setpoint is simultaneously inhibited (r0898.6).

Note:

For encoderless vector control it is not practical to read-in the main setpoint of the speed control via p1155 or p1160 (p0922). In this case, the main setpoint should be injected before the ramp-function generator (p1070). The reason for this is that the ramp-function generator output is automatically set when transitioning from closed-loop speed controlled into open-loop speed controlled operation.

Cause:	The position tracking cannot be reset.
Remedy:	Reset the position tracking as follows: - select encoder commissioning (p0010 = 4). - reset position tracking, position (p2720.2 = 1). - deselect encoder commissioning (p0010 = 0). The fault should then be acknowledged and, if necessary, the absolute encoder adjusted (p2507).

F07447	Load gear: Position tracking, maximum actual value exceeded
Message value:	Component number: %1, encoder data set: %2, drive data set: %3
Drive object:	VECTOR_G130/G150
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	When the position tracking of the load gear is configured, the drive/encoder (motor encoder) identifies a maximum possible absolute position actual value (r2723) that can no longer be represented within 32 bits. Maximum value: $p0408 * p2721 * 2^{p0419}$ Fault value (r0949, interpret hexadecimal): ccbbaa hex aa = encoder data set bb = component number cc = drive data set See also: p0408 (Rotary encoder pulse No.), p0419 (Fine resolution absolute value Gx_XIST2 (in bits)), p2721 (Load gear, rotary absolute gearbox, revolutions, virtual)
Remedy:	- reduce the fine resolution (p0419). - reduce the multiturn resolution (p2721). See also: p0419 (Fine resolution absolute value Gx_XIST2 (in bits)), p2721 (Load gear, rotary absolute gearbox, revolutions, virtual)
F07448 (A)	Load gear: Position tracking, linear axis has exceeded the maximum range
Message value:	-
Drive object:	ENCODER, VECTOR_G130/G150
Reaction:	OFF1 (NONE, OFF2, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	For a configured linear axis/no modulo axis, the currently effective motor encoder (encoder 1) has exceeded the maximum possible traversing range. For the configured linear axis, the maximum traversing range is defined to be $64x (+/- 32x)$ of p0421. It should be read in p2721 and interpreted as the number of load revolutions. Note: Only the motor encoder in the currently effective drive data set is monitored here. The actual effective drive data set is displayed in $x = r0051$ and the corresponding motor encoder is specified in in p0187[x].
Remedy:	The fault should be resolved as follows: - select encoder commissioning (p0010 = 4). - reset position tracking, position (p2720.2 = 1). - deselect encoder commissioning (p0010 = 0). The fault should then be acknowledged and the absolute encoder adjusted.

Message value:	%1
Drive object:	ENCODER, VECTOR_G130/G150
Reaction:	OFF1 (NONE, OFF2, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	When powered down, the currently effective motor encoder was moved through a distance greater than was parameterized in the tolerance window. It is possible that there is no longer any reference between the mechanical system and encoder. Note: Only the motor encoder in the currently effective drive data set is monitored here. The actual effective drive data set is displayed in x = r0051 and the corresponding motor encoder is specified in in p0187[x]. Fault value (r0949, interpret decimal): Deviation (difference) to the last encoder position in increments of the absolute value after the measuring gear - if one is being used. The sign designates the traversing direction. Note: The deviation (difference) found is also displayed in r2724. See also: p2722 (Load gear, position tracking tolerance window), r2724 (Load gear position difference)
Remedy:	Reset the position tracking as follows: - select encoder commissioning (p0010 = 4). - reset position tracking, position (p2720.2 = 1). - deselect encoder commissioning (p0010 = 0). The fault should then be acknowledged and, if necessary, the absolute encoder adjusted (p2507). See also: p0010

F07493	LR: Overflow of the value range for position actual value
Message value:	%1
Drive object:	VECTOR_G130/G150
Reaction:	OFF1 (OFF2, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	The value range (-2147483648 ... 2147483647) for the position actual value representation was exceeded. When the overflow occurs, the "referenced" or "adjustment absolute measuring system" status is reset. Fault value (r0949, interpret decimal): 1: The position actual value (r2521) has exceeded the value range. 2: The encoder position actual value Gn_XIST2 (r0483) or the absolute value after the load gear (r2723) has exceeded the value range. 3: The maximum encoder value times the factor to convert the absolute position (r0483 and/or r2723) from increments to length units (LU) has exceeded the value range for displaying the position actual value.

Remedy: If required, reduce the traversing range or position resolution (p2506).
Increase the fine resolution of absolute position actual value (p0419).
Reference to fault value = 3:
If the value for the maximum possible absolute position (LU) is greater than 4294967296, then it is not possible to make an adjustment due to an overflow.
For rotary encoders, the maximum possible absolute position (LU) is calculated as follows:
1. Motor encoder without position tracking
 $p2506 * p0433 * p2505 / (p0432 * p2504)$
 $p2506 * p0433 * p2505 * p0421 / (p0432 * p2504)$ for multiturn encoders
2. Motor encoder with position tracking for measuring gear:
 $p2506 * p0412 * p2505 / p2504$
3. Motor encoder with position tracking for load gear
 $p2506 * p2721 * p0433 / p0432$

F07494 LR: Drive Data Set changeover in operation

Message value: -
Drive object: VECTOR_G130/G150
Reaction: OFF1 (OFF2, OFF3)
Acknowledge: IMMEDIATELY
Cause: A drive data set changeover (DDS changeover) when the mechanical relationships change (p2503 .. 2506), the direction of rotation (p1821) or the encoder assignment (p2502) were requested during operation.
Remedy: To changeover the drive data set, initially, exit the "operation" mode.

A07495 (F) LR: Reference function interrupted

Message value: -
Drive object: VECTOR_G130/G150
Reaction: NONE
Acknowledge: NONE
Cause: An activated reference function (reference mark search or measuring probe evaluation) was interrupted.
- an encoder fault has occurred (Gn_ZSW.15 = 1).
- position actual value was set during an activated reference function.
- simultaneously activate reference mark search and measuring probe evaluation (BI: p2508 and BI: p2509 = 1 signal).
- activated reference function (reference mark search or measuring probe evaluation) was deactivated (BI: p2508 and BI: p2509 = 0 signal).
Remedy: - check the causes and resolve.
- reset the control (BI: p2508 and BI: p2509 = 0 signal) and activate the requested function.

Cause: It is not possible to enable the basic positioner because at least one signal is missing.
Alarm value (r2124, interpret decimal):
1: EPOS enable missing (BI: p2656).
2: Position actual value, valid feedback signal missing (BI: p2658).
Remedy: Check the appropriate binector inputs and signals.

A07497 LR: Position setting value activated

Message value: -
Drive object: VECTOR_G130/G150
Reaction: NONE

Cause: The position actual value is set to the value received via CI: p2515 while BI: p2514 = 1 signal. A possible system deviation cannot be corrected.
Remedy: None necessary.
The alarm automatically disappears with BI: p2514 = 0 signal.

A07498 (F) LR: Measuring probe evaluation not possible

Message value: %1
Drive object: VECTOR_G130/G150
Reaction: NONE
Acknowledge: NONE
Cause: When evaluating the measuring probe, an error occurred.
Alarm value (r2124, interpret decimal):
6: The input terminal for the measuring probe is not set.
4098: Error when initializing the measuring probe.
4100: The measuring pulse frequency is too high.
> 50000: The measuring clock cycle is not a multiple integer of the position controller clock cycle.
Remedy: Deactivate the measuring probe evaluation (BI: p2509 = 0 signal).
Re alarm value = 6:
Set the input terminal for the measuring probe (p0488, p0489 or p2517, p2518).
Re alarm value = 4098:
Check the Control Unit hardware.
Re alarm value = 4100:
Reduce the frequency of the measuring pulses at the measuring probe.
Re alarm value > 50000:
Set the clock cycle ratio of the measuring clock cycle to the position controller clock cycle to an integer multiple.
To do this, the currently effective measuring clock cycle can be determined from the alarm value as follows:
 $T_{\text{meas}} [125 \mu\text{s}] = \text{alarm value} - 50000$
With PROFIBUS, the measuring clock cycle corresponds to the PROFIBUS clock cycle (r2064[1]).
Without PROFIBUS, the measuring clock cycle is an internal cycle time that cannot be influenced.

Cause:	A motor data set is not assigned to a drive object. All of the existing motor data sets in the drive data sets must be assigned using the MDS number (p0186[0...n]). There must be at least as many drive data sets as motor data sets. Alarm value (r2124, interpret decimal): Number of the motor data set that has not been assigned.
Remedy:	In the drive data sets, assign the non-assigned motor data set using the MDS number (p0186[0...n]). - check whether all of the motor data sets are assigned to drive data sets. - if required, delete superfluous motor data sets. - if required, set up new drive data sets and assign to the corresponding motor data sets. See also: p0187 (Encoder 1 encoder data set number), p0188 (Encoder 2 encoder data set number), p0189 (Encoder 3 encoder data set number)
Remedy:	Every encoder data set must be assigned its own dedicated DRIVE-CLiQ socket. The component numbers of the encoder interfaces (p0141) must have different values within a drive object. The following must apply: p0141[0] not equal to p0141[1] not equal to ... not equal to p0141[n]

F07517	Drive: Encoder data set changeover incorrectly parameterized
Message value:	%1
Drive object:	ENCODER, VECTOR_G130/G150
Reaction:	OFF2

Message value:	Fault cause: %1, component number: %2, encoder data set: %3
Drive object:	ENCODER, VECTOR_G130/G150
Reaction:	OFF2 (IASC/DCBRAKE, NONE, OFF1, OFF3, STOP1, STOP2)
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	The requested position tracking for incremental encoders is not supported. Fault value (r0949, interpret hexadecimal): ccccbaa hex aa = encoder Data Set number bb = component number cccc = fault cause cccc = 00 hex = 0 dec The encoder type does not support the "Position tracking incremental encoder" function. cccc = 01 hex = 1 dec Position tracking cannot be activated because the memory of the internal NVRAM is not sufficient or a Control Unit does not have an NVRAM. cccc = 04 hex = 4 dec A linear encoder is used that does not support the position tracking function. See also: p0404 (Encoder configuration effective), p0411 (Measuring gear, configuration), r0456 (Encoder configuration supported)

Remedy:

- check the encoder parameterization (p0400, p0404).
- use a Control Unit with sufficient NVRAM.
- if required, deselect position tracking for the incremental encoder (p0411.3 = 0).

Drive object:	ENCODER, VECTOR_G130/G150
Reaction:	NONE

Cause:	During encoder identification (waiting) with p0400 = 10100, the encoder could not be identified. Either the wrong encoder has been installed or no encoder has been installed, the wrong encoder cable has been connected or no encoder cable has been connected to the Sensor Module, or the DRIVE-CLiQ component has not been connected to DRIVE-CLiQ. Note: Encoder identification must be supported by the encoder and is possible in the following cases: Encoder with EnDat interface, motor with DRIVE-CLiQ.
Remedy:	- check and, if necessary, connect the encoder and/or encoder cable. - check and, if necessary, establish the DRIVE-CLiQ connection. - in the case of encoders that cannot be identified (e.g. encoders without EnDat interface), the correct encoder type must be entered in p0400.

Cause:	The permissible motor limit current was exceeded. - effective current limit set too low. - current controller not correctly set. - V/f operation: Up ramp was set too short or the load is too high. - V/f operation: Short-circuit in the motor cable or ground fault. - V/f operation: Motor current does not match current of power unit. - Switch to rotating motor without flying restart function (p1200). Note: Limit current = $2 * \text{Minimum}(p0640, 4 * p0305) \geq 2 * p0305$

- Remedy:**
- check the current limits (p0640).
 - vector control: Check the current controller (p1715, p1717).
 - V/f control: Check the current limiting controller (p1340 ... p1346).
 - increase the up ramp (p1120) or reduce the load.
 - check the motor and motor cables for short-circuit and ground fault.
 - check the motor for the star-delta configuration and rating plate parameterization.
 - check the power unit and motor combination.
 - Choose "flying restart" function (p1200) if switched to rotating motor.

- Message value:** -
- Drive object:** VECTOR_G130/G150
- Reaction:** OFF2 (NONE)
- Acknowledge:** IMMEDIATELY
- Cause:** After an internal power-on command, the infeed or drive does not signal ready.
- monitoring time is too short.
 - DC link voltage is not present.
 - associated infeed or drive of the signaling component is defective.
 - supply voltage incorrectly set.
- Remedy:**
- increase the monitoring time (p0857).
 - ensure that there is a DC link voltage. Check the DC link busbar. Enable the infeed.
 - replace the associated infeed or drive of the signaling component.
 - check the line supply voltage setting (p0210).

F07815	Drive: Power unit has been changed
Message value:	Parameter: %1
Drive object:	VECTOR_G130/G150
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	The code number of the actual power unit does not match the saved number. The fault only occurs if the comparator in p9906 or p9908 is not at f 2 (low) or 3 (minimum). Fault value (r0949, interpret decimal): Number of the incorrect parameter. See also: r0200 (Power unit code number actual), p0201 (Power unit code number)
Remedy:	Connect the original power unit and power up the Control Unit again (POWER ON) or set p0201 to r0200 and exit commissioning with p0010 = 0. If the new power unit is accepted, then if required, the current limit p0640 can be reduced by a lower maximum current of the power unit (r0209) (torque limits stay the same). If not only the power unit is changed, but also the motor, then the motor must be re-commissioned (e.g. using p0010 = 1). This is also necessary if motor data is still to be downloaded via DRIVE-CLiQ. If the comparison stage in p9906 is set to 2, 3, then commissioning can be exited (p0010 = 0) and the fault acknowledged. See also: r0200 (Power unit code number actual)

Cause:	The internal armature short-circuit (p1231 = 4) is not possible as Safe Torque Off (STO) is enabled. The pulses cannot be enabled.

F07900 (N, A)	Drive: Motor blocked
Message value:	-
Drive object:	VECTOR_G130/G150
Reaction:	OFF2 (NONE, OFF1, OFF3, STOP1, STOP2)
Acknowledge:	IMMEDIATELY
Cause:	Motor has been operating at the torque limit longer than the time specified in p2177 and below the speed threshold set in p2175. This signal can also be initiated if the speed actual value is oscillating and the speed controller output repeatedly goes to its limit. If the simulation mode is enabled (p1272 = 1) and the closed-loop control with speed encoder activated (p1300 = 21), then the inhibit signal is generated if the encoder signal is not received from a motor that is driven with the torque setpoint of the closed-loop control. See also: p2175 (Motor locked speed threshold), p2177 (Motor locked delay time)
Remedy:	- check that the motor can rotate freely. - check the torque limit: For a positive direction of rotation r1538, for a negative direction of rotation r1539. - check the parameter, message "Motor locked" and if required, correct (p2175, p2177). - check the inversion of the actual value (p0410). - check the motor encoder connection. - check the encoder pulse number (p0408). - for SERVO with encoderless operation and motors with low power ratings (< 300 W), increase the pulse frequency (p1800). - after deselecting the "Basic positioner" (EPOS) function mode, check the motoring (p1528) and regenerative (p1529) torque limit and modify again. - in the simulation mode and operation with speed encoder, the power unit to which the motor is connected must be powered up and must be supplied with the torque setpoint of the simulated closed-loop control. Otherwise, change over to encoderless control (see p1300).

Message value:	-
Drive object:	VECTOR_G130/G150
Reaction:	OFF2 (IASC/DCBRAKE)
Acknowledge:	IMMEDIATELY
Cause:	The maximum permissible speed was either positively or negatively exceeded. The maximum permissible positive speed is formed as follows: Minimum (p1082, Cl: p1085) + p2162 The maximum permissible negative speed is formed as follows: Maximum (-p1082, Cl: 1088) - p2162
Remedy:	The following applies for a positive direction of rotation: - check r1084 and if required, correct p1082, Cl:p1085 and p2162. The following applies for a negative direction of rotation: - check r1087 and if required, correct p1082, Cl:p1088 and p2162. Activate pre-control of the speed limiting controller (p1401 bit 7 = 1). Increase the hysteresis for the overspeed signal p2162. This upper limit is dependent upon the maximum motor speed p0322 and the maximum speed p1082 of the setpoint channel.

F07902 (N, A)	Drive: Motor stalled
Message value:	%1
Drive object:	VECTOR_G130/G150
Reaction:	OFF2 (IASC/DCBRAKE, NONE, OFF1, OFF3, STOP1, STOP2)
Acknowledge:	IMMEDIATELY
Cause:	For a vector drive the system has identified that the motor has stall for a time longer than is set in p2178. Fault value (r0949, interpret decimal): 1: Stall detection using r1408.11 (p1744 or p0492). 2: Stall detection using r1408.12 (p1745). 3: Stall detection using r0056.11 (only for separately excited synchronous motors). See also: p1744 (Motor model speed threshold stall detection), p2178 (Motor stalled delay time)
Remedy:	It should always be carefully ensured that the motor data identification (p1910) as well as the rotating measurement (p1960) were carried out (also refer to r3925). For synchronous motors with encoder, the encoder must have been adjusted (p1990). For closed-loop speed and torque control with speed encoder, the following applies: - check the speed signal (interrupted cable, polarity, pulse number, broken encoder shaft). - check the speed encoder, if another speed encoder was selected using the data set changeover. This must be connected to the same motor that is controlled for the data set changeover. If there is no fault, then the fault tolerance (p1744 and p0492) can be increased. If the stalled motor should take place in the range of the monitor model and for speeds of less than 30 % of the rated motor speed, then a change can be made directly from the current model into the flux impression (p1401.5 = 1). We therefore recommend that the time-controlled model change is switched in (p1750.4 = 1) or the model changeover limits are significantly increased (p1752 > 0.35 * p0311; p1753 = 5 %). For closed-loop speed and torque control without speed encoder, the following applies: - Check whether the drive stalls solely due to the load in controlled mode (r1750.0) or when the speed setpoint is still zero. If so, increase the current setpoint via p1610 or set p1750 bit 2 = 1 (encoderless vector control to standstill for passive loads). - If the motor excitation time (p0346) was significantly reduced and the drive stalls when it is switched on and run immediately, p0346 should be increased again or quick magnetizing selected (p1401). - Check the current limits (p0640, r0067, r0289). If the current limits are too low, then the drive cannot be magnetized. - check the current controller (p1715, p1717) and the speed adaptation controller (p1764, p1767). If the dynamic response was significantly reduced, then this should be increased again. - check the speed encoder, if another speed encoder was selected using the data set changeover. This must be connected to the motor that is controlled for the data set changeover. If there is no fault, then the fault tolerance (p1745) or the delay time (p2178) can be increased. The following generally apply for closed-loop and torque control: - Check whether the motor cables are disconnected. - If the fault occurs with fault value 2 when the motor accelerates very quickly to the field weakening range, the deviation between the flux setpoint and actual value can be reduced and, in turn, the fault message prevented, by reducing p1596. For separately-excited synchronous motors (closed-loop control with speed encoder), the following applies: - check the speed signal (interrupted cable, polarity, pulse number). - ensure the correct motor parameterization (rating plate and equivalent circuit diagram parameters). - check the excitation equipment and the interface to the closed-loop control. - encoder the highest possible dynamic response of the closed-loop excitation current control. - check the speed control for any tendency to oscillate and if resonance effects occur, use a bandstop filter. - do not exceed the maximum speed (p2162). If there is no fault, then the delay time can be increased (p2178).

A07903	Drive: Motor speed deviation
Message value:	-
Drive object:	VECTOR_G130/G150
Reaction:	NONE
Acknowledge:	NONE
Cause:	The absolute value of the speed difference from the two setpoints (p2151, p2154) and the speed actual value (r2169) exceeds the tolerance threshold (p2163) longer than tolerated (p2164, p2166). The alarm is only enabled for p2149.0 = 1. Possible causes could be: - the load torque is greater than the torque setpoint. - when accelerating, the torque/current/power limit is reached. If the limits are not sufficient, then it is possible that the drive has been dimensioned too small. - for closed-loop torque control, the speed setpoint does not track the speed actual value. - for active Vdc controller. For V/f control, the overload condition is detected as the I_{max} controller is active. See also: p2149 (Monitoring configuration)
Remedy:	- increase p2163 and/or p2166. - increase the torque/current/power limits. - for closed-loop torque control: The speed setpoint should track the speed actual value. - deactivate alarm with p2149.0 = 0.

F07906	Armature short-circuit / internal voltage protection: Parameterization error
Message value:	Fault cause: %1, motor data set: %2
Drive object:	VECTOR_G130/G150
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	The armature short-circuit is incorrectly parameterized. Fault value (r0949, interpret decimal): Low word: Motor data set number High word: Cause: 1: A permanent-magnet synchronous motor has not been selected. 2: No induction motor selected. 101: External armature short-circuit: Output (r1239.0) not connected up. 102: External armature short-circuit with contactor feedback signal: No feedback signal connected (BI:p1235). 103: External armature short-circuit without contactor feedback signal: Delay time when opening (p1237) is 0. 201: Internal voltage protection: The maximum output current of the Motor Module (r0209) is less than $1.8 \cdot$ motor short-circuit current (r0331). 202: Internal voltage protection: A Motor Module in booksize or chassis format is not being used. 203: Internal voltage protection: The motor short-circuit current (p0320) is greater than the maximum motor current (p0323). 204: Internal voltage protection: The activation (p1231 = 4) is not given for all motor data sets with synchronous motors (p0300 = 2xx, 4xx).
Remedy:	Re cause 1: - an armature short-circuit / voltage protection is only permissible for permanent-magnetic synchronous motors. The highest position of the motor type in p0300 must either be 2 or 4. Re cause 101: - the contactor for the external armature short-circuit configuration should be controlled using output signal r1239.0. The signal can, e.g. be connected to an output terminal BI: p0738. Before this fault can be acknowledged, p1231 must be set again. Re cause 102: - if the external armature short-circuit with contactor feedback signal (p1231 = 1) is selected, this feedback signal must be connected to an input terminal (e.g. r722.x) and then connected to BI: p1235. - alternatively, the external armature short-circuit without contactor feedback signal (p1231 = 2) can be selected. Re cause 103: - if the external armature short-circuit without contactor feedback signal (p1231 = 2) is selected, then a delay time must be parameterized in p1237. This time must always be greater than the actual contactor opening time, as otherwise the Motor Module would be short-circuited! Re cause 201: - a Motor Module with a higher maximum current or a motor with a lower short-circuit current must be used. The maximum Motor Module current must be higher than $1.8 \cdot$ short-circuit current of the motor. Re cause 202: - for internal voltage protection, use a Motor Module in booksize or chassis format. Re cause 203: - for internal voltage protection, only use short-circuit proof motors. Re cause 204: - The internal voltage protection must either be activated for all motor data sets with synchronous motors (p0300 = 2xx, 4xx) (p1231 = 3) or it must be deactivated for all motor data sets (p1231 not equal to 3). This therefore ensures that the protection cannot be accidentally withdrawn as a result of a data set changeover. The fault can only be acknowledged if this condition is fulfilled.

F07907	Internal armature short-circuit: Motor terminals are not at zero potential after pulse suppression
Message value:	-
Drive object:	VECTOR_G130/G150
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	The function "Internal voltage protection" (p1231 = 3) was activated. The following must be observed: - when the internal voltage protection is active, after pulse suppression, all of the motor terminals are at half of the DC link voltage (without an internal voltage protection, the motor terminals are at zero potential)! - it is only permissible to use motors that are short-circuit proof (p0320 < p0323). - the Motor Module must be able to continually conduct 180% short-circuit current (r0331) of the motor (r0289). - the internal voltage protection cannot be interrupted due to a fault response. If an overcurrent condition occurs during the active, internal voltage protection, then this can destroy the Motor Module and/or the motor. - if the Motor Module does not support the autonomous, internal voltage protection (r0192.10 = 0), in order to ensure safe, reliable functioning when the line supply fails, an external 24 V power supply (UPS) must be used for the components. - if the Motor Module does support the autonomous, internal voltage protection (r0192.10 = 1), in order to ensure safe, reliable functioning when the line supply fails, the 24 V power supply for the components must be provided through a Control Supply Module. - if the internal voltage protection is active, it is not permissible that the motor is driven by the load for a longer period of time (e.g. as a result of loads that move the motor or another coupled motor).

Cause:	The difference between the flux actual value and setpoint has exceeded the tolerance: $\text{abs}(r0084 - r1598) > p3204 + p3205$ The cause of this fault is again reset for $\text{abs}(r0084 - r1598) < p3204$. The fault is only issued after the delay time in p3206 has expired.
Remedy:	- check the parameterization (p3204, p3205). - check the interfaces to the excitation equipment (r1626, p1640). - check the excitation equipment. - check the flux control (p1592, p1592, p1597). - check the control for oscillation and take the appropriate counter measures (e.g. optimize the speed control loop, parameterize a bandstop filter).

A07918 (N)	Three-phase setpoint generator operation selected/active
Message value:	-
Drive object:	VECTOR_G130/G150
Reaction:	NONE
Acknowledge:	NONE
Cause:	Only for separately excited synchronous motors (p0300 = 5): The actual open-loop/closed-loop control mode is I/f control (open-loop) with a fixed current (p1300 = 18). The speed is entered via the setpoint channel and the current setpoint is given by the minimum current (p1620). It must be ensured that in this mode, the control dynamic performance is very limited. This is the reason that longer ramp-up times should be set for the setpoint speed than for normal operation. See also: p1620 (Stator current, minimum)

Cause:	The motor is braked with a DC current, the DC current brake is active. 1) An alarm with response DCBRAKE is active. The motor is braked with the braking current set in p1232 for the duration set in p1233. If the standstill threshold p1226 is undershot, then braking is prematurely canceled. 2) DC braking has been activated at binector input p1230 with the DC brake set (p1230 = 4). Braking current p1232 is injected until this binector input becomes inactive.
Remedy:	None necessary.

F07928	Internal voltage protection initiated
Message value:	-
Drive object:	VECTOR_G130/G150
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	The Motor Module signals that the motor is short-circuited through the power semiconductors (r1239.5 = 1). The pulses cannot be enabled. The internal voltage protection is selected (p1231 = 3).

Remedy: If the Motor Module supports the autonomous internal voltage protection ($r0192.10 = 1$), then the Motor Module automatically decides - using the DC link voltage - as to whether the armature short-circuit should be activated. The armature short-circuit is activated and response OFF2 is initiated if the DC link voltage exceeds 800 V. If the DC link voltage falls below 450 V, then the armature short-circuit is withdrawn. If the motor is still in a critical speed range, the armature short-circuit is reactivated once the DC link voltage exceeds the threshold of 800 V. If the autonomous (independent) internal voltage protection is active ($r1239.5 = 1$) and the line supply returns ($450 \text{ V} < \text{DC link voltage} < 800 \text{ V}$), the armature short-circuit is withdrawn after 3 minute.

Message value: %1
Drive object: VECTOR_G130/G150
Reaction: OFF1 (NONE, OFF2, OFF3)
Acknowledge: IMMEDIATELY
Cause: The Control Unit has detected a brake control error.
 Fault value ($r0949$, interpret decimal):
 10, 11:
 Fault in "open holding brake" operation.
 - No brake connected or wire breakage (check whether brake releases for $p1278 = 1$).
 - Ground fault in brake cable.
 20:
 Fault in "brake open" state.
 - Short-circuit in brake winding.
 30, 31:
 Fault in "close holding brake" operation.
 - No brake connected or wire breakage (check whether brake releases for $p1278 = 1$).
 - Short-circuit in brake winding.
 40:
 Fault in "brake closed" state.
 50:
 Fault in the brake control circuit of the Control Unit or communication fault between the Control Unit and Motor Module (brake control).
 Note:
 The following causes may apply to fault values:
 - motor cable is not shielded correctly.
 - defect in control circuit of the Motor Module.
 See also: $p1278$ (Brake control, diagnostics evaluation)
Remedy:
 - check the motor holding brake connection.
 - check the function of the motor holding brake.
 - check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.
 - check that the electrical cabinet design and cable routing are in compliance with EMC regulations (e.g. shield of the motor cable and brake conductors are connected with the shield connecting plate and the motor connectors are tightly screwed to the housing).
 - replace the Motor Module involved.
 Operation with Safe Brake Module:
 - check the Safe Brake Modules connection.
 - replace the Safe Brake Module.

F07934 (N) Drive: S120 Combi motor holding brake configuration

Message value: %1
Drive object: All objects
Reaction: NONE (OFF1, OFF2, OFF3)
Acknowledge: IMMEDIATELY (POWER ON)
Cause: A connected motor holding brake has been detected with an S120 Combi unit. However, this motor holding brake has not been assigned to just one Combi feed drive and, therefore, brake control is not configured (correctly).
Fault value (r0949, interpret decimal):
0: No motor holding brake assigned (p1215 = 0 or 3 on all S120 Combi feed drives)
1: Multiple holding brakes assigned (p1215 = 1 or 2 on more than one S120 Combi feed drive)
MHB: Motor holding brake.
Remedy: Check whether the motor holding brake has been assigned to one S120 Combi feed drive exclusively (p1215 = 1 or 2).
The fault will only be withdrawn once the motor holding brake has been assigned to just one of the S120 Combi feed drives (p1215 = 1 or 2 for this one drive). From this point, the motor holding brake will be controlled by this drive.

Fault value (r0949, decimal):
1: Current controller limited
2: Motor shaft locked.
4: Encoder speed signal not plausible.
10: Stage 1: The ratio between the measured current and zero current is too low.
11: Stage 2: The ratio between the measured current and zero current is too low.
12: Stage 1: The maximum current was exceeded.
13: Stage 2: The maximum current was exceeded.
14: Current difference to determine the +d axis too low.
15: Second harmonic too low.
16: Drive converter too small for the measuring technique.
17: Abort due to pulse inhibit.

Remedy:

Re fault value = 1:
 Check whether the motor is correctly connected.
 Check whether motor data have been correctly entered.
 Replace the power unit involved.

Re fault value = 2:
 Open the motor holding brake (p1215 = 2) and bring the motor into a no-load condition.

Re fault value = 4:
 Check whether the speed actual value inversion is correct (p0410.0).
 Check whether the motor is correctly connected.
 Check whether the encoder pulse number (p0408) and gearbox factor (p0432, p0433) are correct.
 Check whether the motor pole pair number is correct (p0314).

Re fault value = 10:
 Increase the value for p0325.
 Check whether the motor is correctly connected.
 Replace the power unit involved.

Re fault value = 11:
 Increase the value for p0329.
 Check whether the motor is correctly connected.
 Replace the power unit involved.

Re fault value = 12:

Drive object: VECTOR_G130/G150
Reaction: OFF1 (NONE, OFF2)
Acknowledge: IMMEDIATELY
Cause: A fault has occurred during the encoder test.
Fault value (r0949, interpret decimal):
1: The speed did not reach a steady-state condition.
2: The speed setpoint was not able to be approached as the minimum limiting is active.
3: The speed setpoint was not able to be approached as the suppression (skip) bandwidth is active.
4: The speed setpoint was not able to be approached as the maximum limiting is active.
5: The encoder does not supply a signal.
6: Incorrect polarity.
7: Incorrect pulse number.
8: Noise in the encoder signal or speed controller unstable.
9: Voltage Sensing Module (VSM) incorrectly connected.
Remedy: Re fault value = 1:
- check the motor parameters.
- carry out a motor data identification routine (p1910).
- if required, reduce the dynamic factor (p1967 < 25 %).
Re fault value = 2:
- adapt the speed setpoint (p1965) or adapt the minimum limit (p1080).
Re fault value = 3:
- adapt the speed setpoint (p1965) or suppression (skip) bandwidths (p1091 ... p1094, p1101).
Re fault value = 4:
- adapt the speed setpoint (p1965) or maximum limit (p1082, p1083 and p1086).
Re fault value = 5:
- check the encoder connection. If required, replace the encoder.
Re fault value = 6:
- check the connection assignment of the encoder cable. Adapt the polarity (p0410).
Re fault value = 7:
- adapt the pulse number (p0408).
Re fault value = 8:
- check the encoder connection and encoder cable. It is possible that there is a problem associated with the ground connection.
- reduce the dynamic response of the speed controller (p1460, p1462 and p1470, p1472).
Re fault value = 9:
- check the connections of the Voltage Sensing Module (VSM).
Note:
The encoder test can be switched out (disabled) using p1959.0.

Reaction: OFF2 (NONE, OFF1)

Acknowledge: IMMEDIATELY

Cause:

A fault has occurred during the identification routine.

Fault value (r0949, interpret decimal):

1: Current limit value reached.

2: Identified stator resistance lies outside the expected range 0.1 ... 100% of Zn.

3: Identified rotor resistance lies outside the expected range 0.1 ... 100% of Zn.

Separately excited synchronous motors: damping resistance outside 1.0 ... 15 % of Zn.

4: Identified stator reactance lies outside the expected range 50 ... 900 % of Zn.

Separately excited synchronous motors: stator reactance outside 20 ... 500 % of Zn.

5: Identified magnetizing reactance lies outside the expected range 50 ... 900 % of Zn.

Separately excited synchronous motors: magnetizing reactance outside 20 ... 500 % of Zn.

6: Identified rotor time constant lies outside the expected range 10 ms ... 5 s.

Separately excited synchronous motors: damping time constant outside 5 ms ... 1 s.

7: Identified total leakage reactance lies outside the expected range 4 ... 100 % of Zn.

8: Identified stator leakage reactance lies outside the expected range 2 ... 50% of Zn.

Separately excited synchronous motors: stator leakage reactance outside 2 ... 40 % of Zn.

9: Identified rotor leakage reactance lies outside the expected range 2 ... 50% of Zn.

Separately excited synchronous motors: damping leakage reactance outside 1.5 ... 20 % of Zn.

10: Motor has been incorrectly connected.

11: Motor shaft rotates.

20: Identified threshold voltage of the semiconductor devices lies outside the expected range 0 ... 10 V.

30: Current controller in voltage limiting.

40: At least one identification contains errors. The identified parameters are not saved to prevent inconsistencies.

Note:

Percentage values are referred to the rated motor impedance:

$Z_n = V_{mot,nom} / \sqrt{3} / I_{mot,nom}$

Remedy:

Re fault value = 0:

- check whether the motor is correctly connected. Observe configuration (star-delta).

Re fault value = 1 ... 40:

- check whether motor data have been correctly entered in p0300, p0304 ... p0311.

- is there an appropriate relationship between the motor power rating and that of the Motor Module? The ratio of the Motor Module to the rated motor current should not be less than 0.5 and not be greater than 4.

- check configuration (star-delta).

Also for fault value = 11:

- deactivate vibration monitoring (p1909 bit 7 = 1).

Re fault value = 2:

- for parallel circuits, check the motor winding system in p7003. If, for power units connected in parallel, a motor is specified with a single-winding system (p7003 = 0), although a multi-winding system is being used, then a large proportion of the stator resistance is interpreted as feeder cable resistance and entered in p0352.

Re fault value = 4, 7:

- check whether inductances are correctly entered in p0233 and p0353.

- check whether motor has been correctly connected (star-delta).

F08700 (A)	CAN: Communications error
Message value:	%1
Drive object:	All objects
Reaction:	OFF3 (NONE, OFF1, OFF2)
Acknowledge:	IMMEDIATELY
Cause:	A CAN communications error has occurred. Fault value (r0949, interpret decimal): 1: The error counter for the send telegrams has exceeded the BUS OFF value 255. The bus disables the CAN controller. - bus cable short circuit. - incorrect baud rate. - incorrect bit timing. 2: The master no longer interrogated the CAN node status longer than for its "life time". The "life time" is obtained from the "guard time" (p8604[0]) multiplied by the "life time factor" (p8604[1]). - bus cable interrupted. - bus cable not connected. - incorrect baud rate. - incorrect bit timing. - master fault. Note: The fault response can be set as required using p8641. See also: p8604 (CAN node guarding), p8641 (CAN Abort Connection Option Code)
Remedy:	- check the bus cable - check the baud rate (p8622). - check the bit timing (p8623). - check the master. The CAN controller must be manually restarted with p8608 = 1 after the cause of the fault has been resolved! See also: p8608 (CAN Clear Bus Off Error), p8622 (CAN baud rate), p8623 (CAN Bit Timing selection)

F08701	CAN: NMT state change
Message value:	%1
Drive object:	All objects
Reaction:	OFF3
Acknowledge:	IMMEDIATELY
Cause:	A CANopen NMT state transition from "operational" to "pre-operational" or after "stopped". Fault value (r0949, interpret decimal): 1: CANopen NMT state transition from "operational" to "pre-operational". 2: CANopen NMT state transition from "operational" to "stopped". Note: In the NMT state "pre-operational", process data cannot be transferred and in the NMT state "stopped", no process data and no service data can be transferred.
Remedy:	None necessary. Acknowledge the fault and continue operation.
A08751	CAN: Telegram loss
Message value:	-
Drive object:	All objects
Reaction:	NONE
Acknowledge:	NONE
Cause:	The CAN controller has lost a receive message (telegram).
Remedy:	Reduce the cycle times of the receive messages.

A08752	CAN: Error counter for error passive exceeded
Message value:	-
Drive object:	All objects
Reaction:	NONE
Acknowledge:	NONE
Cause:	The error counter for the send or receive telegrams has exceeded the value 127.
Remedy:	- check the bus cable - set a higher baud rate (p8622). - check the bit timing and if required optimize (p8623). See also: p8622 (CAN baud rate), p8623 (CAN Bit Timing selection)
A08753	CAN: Message buffer overflow
Message value:	%1
Drive object:	All objects
Reaction:	NONE
Acknowledge:	NONE
Cause:	A message buffer overflow. Alarm value (r2124, interpret decimal): 1: Non-cyclic send buffer (SDO response buffer) overflow. 2: Non-cyclic receive buffer (SDO receive buffer) overflow. 3: Cyclic send buffer (PDO send buffer) overflow.
Remedy:	Check the bus cable. Set a higher baud rate (p8622). Check the bit timing and if required optimize (p8623). Alarm value = 2: - reduce the cycle times of the SDO receive messages. - SDO request from master only after SDO feedback for previous SDO request. See also: p8622 (CAN baud rate), p8623 (CAN Bit Timing selection)
A08754	CAN: Incorrect communications mode
Message value:	-

Remedy:	Change to the "pre-operational" or "stopped" mode.
A08755	CAN: Object cannot be mapped
Message value:	-
Drive object:	All objects
Reaction:	NONE
Acknowledge:	NONE
Cause:	The CANopen object is not provided for the Process Data Object (PDO) Mapping.
Remedy:	Use a CANopen object intended for the PDO mapping or enter 0. The following objects can be mapped in the Receive Process Data Object (RPDO) or Transmit Process Data Object (TPDO): - RPDO: 6040 hex, 6060 hex, 60FF hex, 6071 hex; 5800 hex - 580F hex; 5820 hex - 5827 hex - TPDO: 6041 hex, 6061 hex, 6063 hex, 6069 hex, 606B hex, 606C hex, 6074 hex; 5810 hex - 581F hex; 5830 hex - 5837 hex Only sub-index 0 of the specified objects can be mapped. Note: As long as A08755 is present, the COB-ID cannot be set to valid.

A08756 CAN: Number of mapped bytes exceeded

Message value: -
Drive object: All objects
Reaction: NONE
Acknowledge: NONE
Cause: The number of bytes of the mapped objects exceeds the telegram size for net data. A max. of 8 bytes is permissible.
Remedy: Map fewer objects or objects with a smaller data type.

A08757 CAN: Set COB-ID invalid

Message value: -
Drive object: All objects
Reaction: NONE
Acknowledge: NONE
Cause: For online operation, the appropriate COB-ID must be set invalid before mapping.
Example:
Mapping for RPDO 1 should be changed (p8710[0]).
--> set p8700[0] = C00006E0 hex (invalid COB-ID)
--> set p8710[0] as required.
--> p8700[0] enter a valid COB-ID
Remedy: Set the COB-ID to invalid.

A08758 CAN: Number of PDO channels too low

Message value: -
Drive object: All objects
Reaction: NONE
Acknowledge: NONE
Cause: The number of PDO channels in p8740 has either been set to 0 or too low.
See also: p8740 (CAN channel distribution)
Remedy: The number of channels set in p8740 must be greater than or equal to the number of PDOs.
There are 2 possibilities:
Increase the number of channels in p8740 and confirm the selection using p8741.
Reduce the number of PDOs by setting the COB-ID to invalid.
See also: p8740 (CAN channel distribution), p8741 (CAN PDO configuration acknowledgement)

A08759 CAN: PDO COB-ID already available

Message value: -
Drive object: All objects
Reaction: NONE
Acknowledge: NONE
Cause: An existing PDO COB-ID was allocated.
Remedy: Select another PDO COB-ID.

A13000	License not adequate
Message value:	%1
Drive object:	All objects
Reaction:	NONE
Acknowledge:	NONE
Cause:	- for the drive unit, the options that require a license are being used but the licenses are not sufficient. - an error occurred when checking the existing licenses. Alarm value (r2124, interpret decimal): 0: The existing license is not sufficient. 1: An adequate license was not able to be determined as the memory card with the required licensing data was withdrawn in operation. 2: An adequate license was not able to be determined, as an error occurred when reading-out the required licensing data from the memory card. 3: An adequate license was not able to be determined as there is a checksum error in the license key. 4: An internal error occurred when checking the license.
Remedy:	Re alarm value = 0: Additional licenses are required and these must be activated (p9920, p9921). Re alarm value = 1: With the system powered down, re-insert the memory card that matches the system. Re alarm value = 2: Enter and activate the license key (p9920, p9921). Re alarm value = 3: Compare the license key (p9920) entered with the license key on the certificate of license. Re-enter the license key and activate (p9920, p9921). Re alarm value = 4: - carry out a POWER ON. - upgrade firmware to later version. - contact the Hotline.
A13001	Error in license checksum
Message value:	-
Drive object:	All objects
Reaction:	NONE
Acknowledge:	NONE
Cause:	When checking the checksum of the license key, an error was detected.
Remedy:	Compare the license key (p9920) entered with the license key on the certificate of license. Re-enter the license key and activate (p9920, p9921).
F13009	Licensing OA application not licensed
Message value:	%1
Drive object:	All objects
Reaction:	OFF1
Acknowledge:	IMMEDIATELY
Cause:	At least one OA application which is under license does not have a license. Code for unlicensed OA applications corresponds to p4956 or p4955.
Remedy:	- Enter and activate the license key which licenses OA applications under license (p9920, p9921). - Deactivate unlicensed OA applications (p4956).

F13010 Licensing function module not licensed

Message value: %1
Drive object: All objects
Reaction: OFF1
Acknowledge: IMMEDIATELY
Cause: At least one function module which is under license does not have a license.
Fault value (r0949, interpret hexadecimal):
Unlicensed function modules are coded bit by bit. The code corresponds to that used in r0108.
Remedy: - Deactivate unlicensed function modules (p108).
- Enter and activate the license key which licenses function modules under license (p9920, p9921).

F30001 Power unit: Overcurrent

Message value: Fault cause: %1 bin
Drive object: VECTOR_G130/G150
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: The power unit has detected an overcurrent condition.
- closed-loop control is incorrectly parameterized.
- motor has a short-circuit or fault to ground (frame).
- V/f operation: Up ramp set too low.
- V/f operation: Rated motor current is significantly greater than that of the Motor Module.
- infeed: High discharge and post-charging current for voltage dip.
- infeed: High post-charging currents for overload when motoring and DC link voltage dip.
- infeed: Short-circuit currents at power-up due to the missing line reactor.
- power cables are not correctly connected.
- power cables exceed the maximum permissible length.
- power unit defective.
- line phase interrupted.
Additional causes for a parallel switching device (r0108.15 = 1):
- a power unit has tripped (powered down) due to a ground fault.
- the closed-loop circulating current control is either too slow or has been set too fast.
Fault value (r0949, interpret bitwise binary):
Bit 0: Phase U.
Bit 1: Phase V.
Bit 2: Phase W.
Bit 3: Overcurrent in the DC link.
Note:
Fault value = 0 means that the phase with overcurrent is not recognized (e.g. for blocksize device).
Remedy: - check the motor data - if required, carry out commissioning.
- check the motor circuit configuration (star-delta)
- V/f operation: Increase up ramp.
- V/f operation: Check the assignment of the rated currents of the motor and Motor Module.
- infeed: Check the line supply quality.
- infeed: Reduce the motor load.
- infeed: Correct connection of the line reactor.
- check the power cable connections.
- check the power cables for short-circuit or ground fault.
- check the length of the power cables.
- replace power unit.
- check the line supply phases.
For a parallel switching device (r0108.15 = 1) the following additionally applies:
- check the ground fault monitoring thresholds (p0287).
- check the setting of the closed-loop circulating current control (p7036, p7037).

F30002	Power unit: DC link voltage, overvoltage
Message value:	%1
Drive object:	VECTOR_G130/G150
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	The power unit has detected overvoltage in the DC link. - motor regenerates too much energy. - device connection voltage too high. - when operating with a Voltage Sensing Module (VSM), the phase assignment L1, L2, L3 at the VSM differs from the phase assignment at the power unit. - line phase interrupted. Fault value (r0949, interpret decimal): DC link voltage [1 bit = 100 mV]. For SINAMICS GM/SM, the following applies: Fault value (r0949, interpret decimal): 32: Overvoltage in the negative partial DC link (VdcN). 64: Overvoltage in the positive partial DC link (VdcP). 96: Overvoltage in both partial DC links.
Remedy:	- increase the ramp-down time - activate the DC link voltage controller - use a brake resistor or Active Line Module - increase the current limit of the infeed or use a larger module (for the Active Line Module) - check the device supply voltage - check and correct the phase assignment at the VSM and at the power unit - check the line supply phases. - set the rounding times (p1130, p1136). This is particularly recommended in V/f operation to relieve the DC link voltage controller with rapid ramp-down times of the ramp-function generator. See also: p0210 (Drive unit line supply voltage), p1240 (Vdc controller or Vdc monitoring configuration)
F30003	Power unit: DC link voltage, undervoltage
Message value:	-
Drive object:	VECTOR_G130/G150
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	The power unit has detected an undervoltage condition in the DC link. - line supply failure - line supply voltage below the permissible value. - line supply infeed failed or interrupted. - line phase interrupted. Note: The monitoring threshold for the DC link undervoltage is the minimum of the following values: - for a calculation, refer to p0210.
Remedy:	- check the line supply voltage - check the line supply infeed and observe the fault messages relating to it (if there are any) - check the line supply phases. Note: The ready signal for the infeed (r0863) must be connected to the associated drive inputs (p0864). See also: p0210 (Drive unit line supply voltage)

F30004 Power unit: Overtemperature heat sink AC inverter

Message value: %1
Drive object: VECTOR_G130/G150
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: The temperature of the power unit heat sink has exceeded the permissible limit value.
- insufficient cooling, fan failure.
- overload.
- ambient temperature too high.
- pulse frequency too high.
Fault value (r0949):
Temperature [1 bit = 0.01 °C].
Remedy: - check whether the fan is running.
- check the fan elements.
- check whether the ambient temperature is in the permissible range.
- check the motor load.
- reduce the pulse frequency if this is higher than the rated pulse frequency.
Notice:
This fault can only be acknowledged after this alarm threshold for alarm A05000 has been undershot.
See also: p1800 (Pulse frequency setpoint)

F30005 Power unit: Overload I2t

Message value: %1
Drive object: VECTOR_G130/G150
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: The power unit was overloaded (r0036 = 100 %).
- the permissible rated power unit current was exceeded for an inadmissibly long time.
- the permissible load duty cycle was not maintained.
Fault value (r0949, interpret decimal):
I2t [100 % = 16384].
Remedy: - reduce the continuous load.
- adapt the load duty cycle.
- check the motor and power unit rated currents.
- increase p0294
See also: r0036 (Power unit overload I2t), r0206 (Rated power unit power), p0307 (Rated motor power)

F30006 Power unit: Thyristor Control Board

Message value: -
Drive object: VECTOR_G130/G150
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: The Thyristor Control Board (TCB) of the Basic Line Module signals a fault.
- there is no line supply voltage.
- the line contactor is not closed.
- the line supply voltage is too low.
- line supply frequency outside the permissible range (45 ... 66 Hz).
- there is a DC link short-circuit.
- there is a DC link short-circuit (during the pre-charging phase).
- voltage supply for the Thyristor Control Board outside the nominal range (5 ... 18 V) and line voltage >30 V.
- there is an internal fault in the Thyristor Control Board.
Remedy: The faults must be saved in the Thyristor Control Board and must be acknowledged. To do this, the supply voltage of the Thyristor Control Board must be switched out for at least 10 s!
- check the line supply voltage
- check or energize the line contactor.
- check the monitoring time and, if required, increase (p0857).
- if required, observe additional power unit messages/signals.
- check the DC link regarding short-circuit or ground fault.
- evaluate diagnostic LEDs for the Thyristor Control Board.

F30008	Power unit: Sign-of-life error cyclic data
Message value:	-
Drive object:	VECTOR_G130/G150
Reaction:	NONE (OFF1, OFF2, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	The power unit has detected that the cyclic setpoint telegrams of the Control Unit have not been updated on time. The number of consecutive sign-of-life errors has exceeded the fault threshold (p7789).
Remedy:	- check the electrical cabinet design and cable routing for EMC compliance - for projects with the VECTOR drive object, check whether p0117 = 6 has been set on the Control Unit. - increase the fault threshold (p7789). See also: p0117 (Current controller computing dead time mode)
A30010 (F)	Power unit: Sign-of-life error cyclic data
Message value:	-
Drive object:	VECTOR_G130/G150
Reaction:	NONE
Acknowledge:	NONE
Cause:	A DRIVE-CLiQ communication error has occurred between the Control Unit and the power unit involved. The cyclic setpoint telegrams of the Control Unit were not received on time by the power unit for at least one clock cycle.
Remedy:	- check the electrical cabinet design and cable routing for EMC compliance
Reaction upon F:	NONE (OFF1, OFF2, OFF3)
Acknowl. upon F:	IMMEDIATELY (POWER ON)
F30011	Power unit: Line phase failure in main circuit
Message value:	-
Drive object:	VECTOR_G130/G150
Reaction:	OFF2 (OFF1)
Acknowledge:	IMMEDIATELY
Cause:	A line phase failure was detected at the power unit. - the fuse of a phase of a main circuit has ruptured. - the DC link voltage ripple has exceeded the permissible limit value. Note: The cause may also be a phase failure in the motor feeder cable.
Remedy:	- check the main circuit fuses. - check the motor feeder cables.
F30012	Power unit: Temperature sensor heat sink wire breakage
Message value:	%1
Drive object:	VECTOR_G130/G150
Reaction:	OFF1 (OFF2)
Acknowledge:	IMMEDIATELY
Cause:	The connection to one of the heat sink temperature sensors in the power unit is interrupted. F30013 Power unit: Temperature sensor heat sink short-circuit

Message value: %1
Drive object: VECTOR_G130/G150
Reaction: OFF1 (OFF2)
Acknowledge: IMMEDIATELY
Cause: The heat sink temperature sensor in the power unit is short-circuited.
Fault value (r0949, interpret hexadecimal):
Bit 0: Module slot (electronics slot)
Bit 1: Air intake
Bit 2: Inverter 1
Bit 3: Inverter 2
Bit 4: Inverter 3
Bit 5: Inverter 4
Bit 6: Inverter 5
Bit 7: Inverter 6
Bit 8: Rectifier 1
Bit 9: Rectifier 2
Remedy: Contact the manufacturer.

F30015 Power unit: Phase failure motor feeder cable

Message value: -
Drive object: VECTOR_G130/G150
Reaction: OFF2 (NONE, OFF1, OFF3)
Acknowledge: IMMEDIATELY
Cause: A phase failure was detected at the power unit output (motor feeder cable). Chassis power units do not feature phase failure monitoring.
Note:
The fault can also be signaled if the drive stalled in V/f control. In this particular case, a phase failure does not necessarily have to be present, but a current of 0 was measured in one phase due to current dissymmetry.
Remedy:
1. Check the motor feeder cables.
2. If the drive has stalled in V/f control, the acceleration or deceleration time (p1120) should be increased.

A30016 (N) Power unit: Load supply switched out

Message value: %1
Drive object: VECTOR_G130/G150
Reaction: NONE
Acknowledge: NONE
Cause: The DC link voltage is too low.
Alarm value (r2124, interpret decimal):
DC link voltage in [V].
Remedy:
- switch on load supply.
- check the line supply if necessary.
Reaction upon N: NONE
Acknowl. upon N: NONE

F30017	Power unit: Hardware current limit has responded too often
Message value:	Fault cause: %1 bin
Drive object:	VECTOR_G130/G150
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	The hardware current limitation in the relevant phase (see A30031, A30032, A30033) has responded too often. The number of times the limit has been exceeded depends on the design and type of power unit. For infeed units, the following applies: - closed-loop control is incorrectly parameterized. - load on the infeed is too high. - Voltage Sensing Module incorrectly connected. - line reactor missing or the incorrect type. - power unit defective. The following applies to Motor Modules: - closed-loop control is incorrectly parameterized. - fault in the motor or in the power cables. - the power cables exceed the maximum permissible length. - motor load too high - power unit defective. Fault value (r0949, interpret binary): Bit 0: Phase U Bit 1: Phase V Bit 2: Phase W
Remedy:	For infeed units, the following applies: - check the controller settings and reset and identify the controller if necessary (p0340 = 2, p3410 = 5) - reduce the load and increase the DC-link capacitance or use a higher-rating infeed if necessary - check the connection of the optional Voltage Sensing Module - check the connection and technical data of the line reactor - check the power cables for short-circuit or ground fault. - replace power unit. The following applies to Motor Modules: - check the motor data. - check the motor circuit configuration (star-delta). - check the motor load. - check the power cable connections. - check the power cables for short-circuit or ground fault. - check the length of the power cables. - replace power unit.
F30020	Power unit: Configuration not supported
Message value:	%1
Drive object:	VECTOR_G130/G150
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	A configuration is requested that is not supported by the power unit. Fault value (r0949, interpret hexadecimal): 0: Autonomous operation is requested but is not supported.
Remedy:	Re fault value = 0: If internal voltage protection is active (p1231 = 3), deactivate it if necessary. See also: p1231 (Armature short-circuit / DC brake configuration)

F30021 Power unit: Ground fault

Message value: %1
Drive object: VECTOR_G130/G150
Reaction: OFF2
Acknowledge: IMMEDIATELY
Cause: Power unit has detected a ground fault.
- ground fault in the power cables.
- winding fault or ground fault at the motor.
- CT defective.
Additional cause for CU310/CUA31:
- when the brake is applied, this causes the hardware DC current monitoring to respond.
Additional cause for parallel switching devices (r0108.15 = 1):
- the closed-loop circulating current control is either too slow or has been set too fast.
Fault value (r0949, interpret decimal):
Absolute value, total current amplitude [20479 = r0209 * 1.4142].
Remedy: - check the power cable connections.
- check the motor.
- check the CT.
The following applies additionally for CU310/CUA31:
- check the cables and contacts of the brake connection (a wire is possibly broken).
For parallel switching devices (r0108.15 = 1) the following additionally applies:
- check the ground fault monitoring thresholds (p0287).
- check the setting of the closed-loop circulating current control (p7036, p7037).
See also: p0287 (Ground fault monitoring thresholds)

F30022 Power unit: Monitoring V_{ce}

Message value: Fault cause: %1 bin
Drive object: VECTOR_G130/G150
Reaction: OFF2
Acknowledge: POWER ON
Cause: In the power unit, the monitoring of the collector-emitter voltage (V_{ce}) of the semiconductor has responded.
Possible causes:
- fiber-optic cable interrupted.
- power supply of the IGBT gating module missing.
- short-circuit at the power unit output.
- defective semiconductor in the power unit.
Fault value (r0949, interpret binary):
Bit 0: Short-circuit in phase U
Bit 1: Short circuit in phase V
Bit 2: Short-circuit in phase W
Bit 3: Light transmitter enable defective
Bit 4: V_{ce} group fault signal interrupted
See also: r0949 (Fault value)
Remedy: - check the fiber-optic cable and if required, replace.
- check the power supply of the IGBT gating module (24 V).
- check the power cable connections.
- select the defective semiconductor and replace.

A30023	Power unit: Overtemperature thermal model alarm
Message value:	-
Drive object:	VECTOR_G130/G150
Reaction:	NONE
Acknowledge:	NONE
Cause:	The temperature difference between the heat sink and chip has exceeded the permissible limit value. - the permissible load duty cycle was not maintained. - insufficient cooling, fan failure. - overload. - ambient temperature too high. - pulse frequency too high. See also: r0037
Remedy:	- adapt the load duty cycle. - check whether the fan is running. - check the fan elements. - check whether the ambient temperature is in the permissible range. - check the motor load. - reduce the pulse frequency if this is higher than the rated pulse frequency. - if DC brake is active: reduce braking current (see p1232).

F30024	Power unit: Overtemperature thermal model

Cause:	Chip temperature of the semiconductor has exceeded the permissible limit value. - the permissible load duty cycle was not maintained. - insufficient cooling, fan failure. - overload. - ambient temperature too high. - pulse frequency too high. Fault value (r0949): Temperature difference between the heat sink and chip [1 Bit = 0.01 °C].

Remedy:

- adapt the load duty cycle.
- check whether the fan is running.
- check the fan elements.
- check whether the ambient temperature is in the permissible range.
- check the motor load.
- reduce the pulse frequency if this is higher than the rated pulse frequency.

F30027 Power unit: Precharging DC link time monitoring

Message value: Enable signals: %1, Status: %2

Drive object: VECTOR_G130/G150

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: The power unit DC link was not able to be pre-charged within the expected time.

- 1) There is no line supply voltage connected.
- 2) The line contactor/line side switch has not been closed.
- 3) The line supply voltage is too low.
- 4) Line supply voltage incorrectly set (p0210).
- 5) The pre-charging resistors are overheated as there were too many pre-charging operations per time unit.
- 6) The pre-charging resistors are overheated as the DC link capacitance is too high.
- 7) The pre-charging resistors are overheated because when there is no "ready for operation" (r0863.0) of the infeed unit, power is taken from the DC link.
- 8) The pre-charging resistors are overheated as the line contactor was closed during the DC link fast discharge through the Braking Module.
- 9) The DC link has either a ground fault or a short-circuit.
- 10) The pre-charging circuit is possibly defective (only for chassis units).

Fault value (r0949, interpret binary):
Missing internal enable signals, power unit (lower 16 bit):

11: Pre-charging completed, ready for pulse enable
12: It was detected that the STO terminal was energized at the power unit

See also: p0210 (Drive unit line supply voltage)

Remedy:

In general:

- check the line supply voltage at the input terminals.
- check the line supply voltage setting (p0210).
- the following applies to booksize units: Wait (approx. 8 min.) until the pre-charging resistors have cooled down. For this purpose, preferably disconnect the infeed unit from the line supply.

Re 5):

- carefully observe the permissible pre-charging frequency (refer to the appropriate Equipment Manual).

Re 6):

- check the total capacitance of the DC link and reduce in accordance with the maximum permissible DC-link capacitance if necessary (refer to the appropriate Equipment Manual)

Re 7):

- interconnect the ready-for-operation signal from the infeed unit (r0863.0) in the enable logic of the drives connected to this DC link

Re 8):

- check the connections of the external line contactor. The line contactor must be open during DC-link fast discharge.

Re 9):

- check the DC link for ground faults or short circuits.

F30080 Power unit: Current increasing too quickly

Message value: Fault cause: %1 bin

Drive object: All objects

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: The power unit has detected an excessive rate of rise in the overvoltage range.

- closed-loop control is incorrectly parameterized.
- motor has a short-circuit or fault to ground (frame).
- V/f operation: Up ramp set too low.
- V/f operation: Rated motor current is significantly greater than that of the Motor Module.
- infeed: High discharge and post-charging current for voltage dip.
- infeed: High post-charging currents for overload when motoring and DC link voltage dip.
- infeed: Short-circuit currents at power-up due to the missing line reactor.
- power cables are not correctly connected.
- power cables exceed the maximum permissible length.
- power unit defective.

Additional causes for a parallel switching device (r0108.15 = 1):

- a power unit has tripped (powered down) due to a ground fault.

Fault value (r0949, interpret bitwise binary):

Bit 0: Phase U.
 Bit 1: Phase V.
 Bit 2: Phase W.

Remedy:

- check the motor data - if required, carry out commissioning.
- check the motor circuit configuration (star-delta)
- V/f operation: Increase up ramp.
- V/f operation: Check the assignment of the rated currents of the motor and Motor Module.
- infeed: Check the line supply quality.
- infeed: Reduce the motor load.
- infeed: Correct connection of the line reactor.
- check the power cable connections.
- check the power cables for short-circuit or ground fault.
- check the length of the power cables.
- replace power unit.

For a parallel switching device (r0108.15 = 1) the following additionally applies:

- check the ground fault monitoring thresholds (p0287).
- check the setting of the closed-loop circulating current control (p7036, p7037).

Acknowledge: IMMEDIATELY (POWER ON)

Cause:

The drive-based "Safety Integrated" function in the Motor Module (MM) has detected a fault in the data cross-check between the Control Unit (CU) and MM and initiated a STOP F.

As a result of this fault, after the parameterized transition has expired (p9858), fault F30600 is output (SI MM: STOP A initiated).

Fault value (r0949, interpret decimal):

0: Stop request from the Control Unit.

1 ... 999:

Number of the cross-checked data that resulted in this fault. This number is also displayed in r9895.

1: SI monitoring clock cycle (r9780, r9880).

2: SI enable safety functions (p9601, p9801). Crosswise data comparison is only carried out for the supported bits.

3: SI SGE changeover tolerance time (p9650, p9850).

4: SI transition period STOP F to STOP A (p9658, p9858).

5: SI enable Safe Brake Control (p9602, p9802).

6: SI Motion enable, safety-relevant functions (p9501, internal value).

7: SI pulse suppression delay time for Safe Stop 1 (p9652, p9852).

8: SI PROFIsafe address (p9610, p9810).

9: SI debounce time for STO/SBC/SS1 (MM) (p9651, p9851).

11: SI Safe Brake Adapter mode, BICO interconnection (p9621, p9821).

12: SI Safe Brake Adapter relay ON time (p9622[0], p9822[0]).

13: SI Safe Brake Adapter relay OFF time (p9622[1], p9822[1]).

1000: Watchdog timer has expired. Within the time of approx. 5 * p9850 too many switching operations have occurred at the safety-related inputs of the Control Unit, or STO (also as subsequent response) was initiated too frequently via PROFIsafe/TM54F.

1001, 1002: Initialization error, change timer / check timer.

2000: Status of the STO selection on the Control Unit and Motor Module are different.

2001: Feedback signal for safe pulse suppression on the Control Unit and Motor Module are different.

2002: Status of the delay timer SS1 on the Control Unit and Motor Module are different.

6000 ... 6999:

Error in the PROFIsafe control. The significance of the individual message values is described in safety message C01711 of the Control Unit.

Remedy:

Re fault value = 1 ... 5 and 7 ... 999:

- check the cross-checked data that resulted in a STOP F.
- carry out a POWER ON (power off/on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

Re fault value = 6:

- carry out a POWER ON (power off/on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

Re fault value = 1000:

- check the wiring of the safety-relevant inputs (SGE) on the Control Unit (contact problems).
- PROFIsafe: Remove contact problems/faults at the PROFIBUS master/PROFINET controller. - check the wiring of the fail-safe inputs at the TM54F (contact problems).

Re fault value = 1001, 1002:

- carry out a POWER ON (power off/on) for all components.
- upgrade the Motor Module software.
- upgrade the Control Unit software.

Re fault value = 2000, 2001, 2002:

- check the tolerance time SGE changeover and if required, increase the value (p9650/p9850, p9652/p9852).
- check the wiring of the safety-relevant inputs (SGE) (contact problems).
- check the cause of the STO selection in r9772. When the SMM functions are active (p9501 = 1), STO can also be selected using these functions.
- replace the Motor Module involved.

F30625 SI MM: Sign-of-life error in safety data

Message value: %1
Drive object: VECTOR_G130/G150
Reaction: OFF2
Acknowledge: IMMEDIATELY (POWER ON)
Cause: The drive-based "Safety Integrated" function on the Motor Module (MM) has detected an error in the sign-of-life of the safety data between the Control Unit (CU) and MM and initiated a STOP A.
 - there is either a DRIVE-CLiQ communication error or communication has failed.
 - a time slice overflow of the safety software has occurred.
 Fault value (r0949, interpret decimal):
 Only for internal Siemens troubleshooting.

Remedy:
 - select Safe Torque Off and deselect again.
 - carry out a POWER ON (power off/on) for all components.
 - check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.
 - deselect all drive functions that are not absolutely necessary.
 - reduce the number of drives.
 - check the electrical cabinet design and cable routing for EMC compliance

 83: SafeBrakeAdapter: Fault in "close brake" state.

84,85:

SafeBrakeAdapter: Fault in the brake control circuit of the Control Unit or communication fault between Control Unit and Motor Module (brake control).

Note:

The following causes may apply to fault values:

- motor cable is not shielded correctly.
- defect in control circuit of the Motor Module.

Remedy:

- check parameter p1278 (for SBC, only p1278 = 0 is permissible).
 - select Safe Torque Off and deselect again.
 - check the motor holding brake connection.
 - check the function of the motor holding brake.
 - check whether there is a DRIVE-CLiQ communication error between the Control Unit and the Motor Module involved and, if required, carry out a diagnostics routine for the faults identified.
 - check that the electrical cabinet design and cable routing are in compliance with EMC regulations (e.g. shield of the motor cable and brake conductors are connected with the shield connecting plate and the motor connectors are tightly screwed to the housing).
 - replace the Motor Module involved.
- Operation with Safe Brake Module or Safe Brake Adapter:
- check the Safe Brake Module or Safe Brake Adapter connection.

Cause: The Motor Module has detected a communications error with the higher-level control or the TM54F to transfer the safety-relevant information.

Note:

This fault results in a STOP A that can be acknowledged.

Fault value (r0949, interpret decimal):

Only for internal Siemens troubleshooting.

Remedy:

For the higher-level control, the following applies:

- check the PROFIsafe address in the higher-level control and Motor Modules and if required, align.
- save all parameters (p0977 = 1).
- carry out a POWER ON (power off/on) for all components.

For TM54F, carry out the following steps:

- start the copy function for the node identifier (p9700 = 1D hex).
- acknowledge hardware CRC (p9701 = EC hex).
- save all parameters (p0977 = 1).
- carry out a POWER ON (power off/on) for all components.

The following generally applies:

- upgrade the Motor Module software.

C30706 SI Motion MM: SBR limit exceeded

Message value: -
Drive object: VECTOR_G130/G150
Reaction: NONE
Acknowledge: IMMEDIATELY (POWER ON)
Cause: Motion monitoring functions with encoder: SBR - Safe Acceleration Monitoring. After initiating STOP B (SS1) or STOP C (SS2), the speed has exceeded the selected tolerance.
Encoderless motion monitoring function: SBR - Safe Brake Ramp Monitoring. After initiating STOP B (SS1) or SLS changeover to the lower speed stage, the speed has exceeded the selected tolerance.
The drive is shut down by the message C30700 "SI Motion MM: STOP A initiated".
Remedy: Check the braking behavior and, if necessary, adapt the tolerance for the "Safe Acceleration Monitor" or modify the parameter settings for the "safe brake ramp".
This message can only be acknowledged via the Terminal Module 54F (TM54F) or PROFIsafe.

C30707 SI Motion MM: Tolerance for safe operating stop exceeded

Message value: -
Drive object: VECTOR_G130/G150
Reaction: NONE
Acknowledge: IMMEDIATELY (POWER ON)
Cause: The actual position has distanced itself further from the target position than the standstill tolerance.
The drive is shut down by the message C30701 "SI Motion MM: STOP B initiated".
Remedy: - check whether safety faults are present and if required carry out the appropriate diagnostic routines for the particular faults.
- check whether the standstill tolerance matches the accuracy and control dynamic performance of the axis.
This message can only be acknowledged via the Terminal Module 54F (TM54F) or PROFIsafe.
Note:
SI: Safety Integrated
SOS: Safe Operating Stop / SBH: Safe operating stop

C30708 SI Motion MM: STOP C initiated

Message value: -

Drive object: VECTOR_G130/G150

Reaction: STOP2

Acknowledge: IMMEDIATELY (POWER ON)

Cause: The drive is stopped via a STOP C (braking along the OFF3 ramp).
 "Safe Operating Stop" (SOS) is activated after the parameterized timer has expired.
 Possible causes:
 - stop request from the higher-level control.
 - subsequent response to the message C30714 "SI Motion MM: Safely limited speed exceeded".
 See also: p9552 (SI Motion transition time STOP C to SOS (SBH) (Control Unit))

Remedy: - remove the cause of the fault at the control.
 - carry out a diagnostics routine for message C30714.
 This message can only be acknowledged via the Terminal Module 54F (TM54F) or PROFIsafe.

Note:
 SI: Safety Integrated

C30709 SI Motion MM: STOP D initiated

Message value: -

Drive object: VECTOR_G130/G150

Reaction: NONE

Acknowledge: IMMEDIATELY (POWER ON)

Cause: The drive is stopped via a STOP D (braking along the path).
 "Safe Operating Stop" (SOS) is activated after the parameterized timer has expired.
 Possible causes:
 - stop request from the Control Unit.
 - subsequent response to the message C30714 "SI Motion: Safely limited speed exceeded".
 See also: p9353 (SI Motion transition time STOP D to SOS (Motor Module)), p9553 (SI Motion transition time STOP D to SOS (SBH) (Control Unit))

Remedy: - remove the cause of the fault at the control.
 - carry out a diagnostics routine for message C30714.
 This message can only be acknowledged via the Terminal Module 54F (TM54F) or PROFIsafe.

C30711 SI MM MM: Defect in a monitoring channel

Message value: %1

Drive object: VECTOR_G130/G150

Reaction: NONE

Acknowledge: IMMEDIATELY (POWER ON)

Cause: When cross-checking and comparing the two monitoring channels, the drive detected a difference between the input data or results of the monitoring functions and initiated a STOP F. One of the monitoring functions no longer reliably functions - i.e. safe operation is no longer possible.
 If at least one monitoring function is active, then after the parameterized timer has expired, the message C30701 "SI Motion: STOP B initiated" is output. The message is output with message value 1031 when the Sensor Module hardware is replaced.
 The following message values may also occur in the following cases if the cause that is explicitly mentioned does not apply:
 - differently parameterized cycle times (p9500/p9300, p9511/p9311).
 - differently parameterized axis types (p9502/p9302).
 - excessively fast cycle times (p9500/p9300, p9511/p9311).
 - incorrect synchronization.

Message value (r9749, interpret decimal):

0 ... 999: Number of the cross-checked data that resulted in this message. Refer to safety message C01711 for a description of the individual data.

The significance of the individual message values is described in safety message C01711 of the Control Unit.

1000: Watchdog timer has expired. Too many signal changes have occurred at safety-relevant inputs.

1001: Initialization error of watchdog timer.

1005: Pulses already suppressed for test stop selection.

1011: Acceptance test status between the monitoring channels differ.

1012: Plausibility violation of the actual value from the encoder.

1020: Cyc. communication failure between the monit. cycles.

1021: Cyc. communication failure between the monit. channel and Sensor Module.

1023: Error in the effectiveness test in the DRIVE-CLiQ encoder

1030: Encoder fault detected from another monitoring channel.

1031: Data transfer error between the monitoring channel and the Sensor Module (p9526/p9326).

1040: Pulses suppressed with active encoderless monitoring functions.

1041: Current absolute value too low (encoderless)

1042: Current/voltage plausibility error

1043: Too many acceleration phases

1044: Actual current values plausibility error.

5000 ... 5140: PROFIsafe message values.

The significance of the individual message values is described in safety message C01711 of the Control Unit.

6000 ... 6166: PROFIsafe message values (PROFIsafe driver for PROFIBUS DP V1/V2 and PROFINET).

The significance of the individual message values is described in safety message C01711 of the Control Unit.

See also: p9555 (SI Motion transition time STOP F to STOP B (Control Unit)), r9725 (SI Motion, diagnostics STOP F)

Remedy:

Re message value = 1030:

- check the encoder connection.
- if required, replace the encoder.

Re message value = 1031:

When replacing a Sensor Module, carry out the following steps:

- start the copy function for the node identifier on the drive (p9700 = 1D hex).
- acknowledge the hardware CRC on the drive (p9701 = EC hex).
- save all parameters (p0977 = 1).
- carry out a POWER ON (power off/on) for all components.

The following always applies:

- check the encoder connection.
- if required, replace the encoder.

Re message value = 1040:

- deselect encoderless monitoring functions, select and deselect STO.
- if monitoring function is active, issue SLS pulse enable within 5 s of deselecting STO.

Re other message values:

- The significance of the individual message values is described in safety message C01711 of the Control Unit.

Note:

This message can only be acknowledged via the Terminal Module 54F (TM54F) or PROFIsafe.

C30712	SI Motion MM: Defect in F-IO processing
Message value:	%1
Drive object:	VECTOR_G130/G150
Reaction:	NONE
Acknowledge:	IMMEDIATELY (POWER ON)
Cause:	When cross checking and comparing the two monitoring channels, the drive detected a difference between parameters or results of the F-IO processing and initiated a STOP F. One of the monitoring functions no longer reliably functions - i.e. safe operation is no longer possible. The safety message C30711 with message value 0 is also displayed due to initiation of STOP F. If at least one monitoring function is active, the safety message C30701 "SI Motion: STOP B initiated" is output after the parameterized timer has expired. Message value (r9749, interpret decimal): Number of the cross-checked data that resulted in this message. Refer to the description of the message values in safety message C01712.

Remedy:

- check parameterization in the parameters involved and correct if required.
- ensure equality by copying the SI data to the second channel and then carry out an acceptance test.
- check monitoring clock cycle in p9500 and p9300 for equality.

Note:
This message can be acknowledged via F-DI or PROFIsafe.

C30714 SI Motion MM: Safely-Limited Speed exceeded

Message value: %1
Drive object: VECTOR_G130/G150
Reaction: NONE
Acknowledge: IMMEDIATELY (POWER ON)
Cause: The drive had moved faster than that specified by the velocity limit value (p9331). The drive is stopped as a result of the configured stop response (p9363).
 Message value (r9749, interpret decimal):
 100: SLS1 exceeded.
 200: SLS2 exceeded.
 300: SLS3 exceeded.
 400: SLS4 exceeded.
 1000: Encoder limit frequency exceeded.

Remedy:

- check the traversing/motion program in the control.
- check the limits for "Safely-Limited Speed" (SLS) and if required, adapt (p9331).

This message can only be acknowledged via the Terminal Module 54F (TM54F) or PROFIsafe.

F31100 (N, A) Encoder 1: Zero mark distance error

Message value:	%1
Drive object:	ENCODER, VECTOR_G130/G150
Reaction:	ENCODER (IASC/DCBRAKE, OFF1, OFF2, OFF3, STOP1, STOP2)
Acknowledge:	PULSE INHIBIT
Cause:	The measured zero mark distance does not correspond to the parameterized zero mark distance. For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). Fault value (r0949, interpret decimal): Last measured zero mark distance in increments (4 increments = 1 encoder pulse). The sign designates the direction of motion when detecting the zero mark distance. See also: p0491 (Motor encoder fault response ENCODER)
Remedy:	- check that the encoder cables are routed in compliance with EMC. - check the plug connections . check the encoder type (encoder with equidistant zero marks). - adapt the parameter for the distance between zero marks (p0424, p0425). - if message output above speed threshold, reduce filter time if necessary (p0438). - replace the encoder or encoder cable

Cause:	The amplitude of the reference track signal (track R) does not lie within the tolerance bandwidth for encoder 1. The fault can be initiated when the unipolar voltage level is exceeded (RP/RN) or if the differential amplitude is under-shot. Fault value (r0949, interpret hexadecimal): xxxx hex: xxxx = Signal level, track R (16 bits with sign). The response thresholds of the unipolar signal levels of the encoder are between < 1400 mV and > 3500 mV. The response threshold for the differential signal level of the encoder is < -1600 mV. See also: p0491 (Motor encoder fault response ENCODER)
Remedy:	- check the speed range; frequency characteristic (amplitude characteristic) of the measuring equipment might not be sufficient for the speed range - check that the encoder cables and shielding are routed in compliance with EMC. - check the plug connections and contacts of the encoder cable. - check whether the zero mark is connected and the signal cables RP and RN have been connected correctly - replace the encoder cable. - if the coding disk is soiled or the lighting aged, replace the encoder.

Cause:	Absolute encoder: When cyclically reading the absolute position, an excessively high difference to the incremental position was detected. The absolute position that was read is rejected. Limit value for the deviation: - EnDat encoder: Is supplied from the encoder and is a minimum of 2 quadrants (e.g. EQI 1325 > 2 quadrants, EQN 1325 > 50 quadrants). - other encoders: 15 pulses = 60 quadrants. Incremental encoder: When the zero pulse is passed, a deviation in the incremental position was detected. Message value:	%1
Drive object:	ENCODER, VECTOR_G130/G150
Reaction:	NONE
Acknowledge:	NONE
Cause:	The measured zero mark distance does not correspond to the parameterized zero mark distance. For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). Alarm value (r2124, interpret decimal): Last measured zero mark distance in increments (4 increments = 1 encoder pulse). F31500 (N, A)	Encoder 1: Position tracking traversing range exceeded
Message value:	-
Drive object:	ENCODER, VECTOR_G130/G150
Reaction:	OFF1 (NONE, OFF2, OFF3)
Acknowledge:	IMMEDIATELY
Cause:	For a configured linear axis without modulo correction, the drive/encoder has exceeded the maximum possible traversing range. The value should be read in p0412 and interpreted as the number of motor revolutions. For p0411.0 = 1, the maximum traversing range for the configured linear axis is defined to be 64x (+/- 32x) of p0421. For p0411.3 = 1, the maximum traversing range for the configured linear axis is preset (default value) to the highest possible value and is +/-p0412/2 (rounded off to complete revolutions). The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).
Remedy:	The fault should be resolved as follows: - select encoder commissioning (p0010 = 4). - reset the position tracking as follows (p0411.2 = 1). - deselect encoder commissioning (p0010 = 0). The fault should then be acknowledged and the absolute encoder adjusted.

A31811 (F, N)	Encoder 1: Encoder serial number changed
Message value:	-
Drive object:	ENCODER, VECTOR_G130/G150
Reaction:	NONE
Acknowledge:	NONE
Cause:	The serial number of the motor encoder of a synchronous motor has changed. The change was only checked for encoders with serial number (e.g. EnDat encoders) and build-in motors (e.g. p0300 = 401) or third-party motors (p0300 = 2). Cause 1: The encoder was replaced. Cause 2: A third-party, build-in or linear motor was re-commissioned. Cause 3: The motor with integrated and adjusted encoder was replaced. Cause 4: The firmware was updated to a version that checks the encoder serial number.

Note:

With closed-loop position control, the serial number is accepted when starting the adjustment (p2507 = 2).
When the encoder is adjusted (p2507 = 3), the serial number is checked for changes and if required, the adjustment is reset (p2507 = 1).

Proceed as follows to hide serial number monitoring:

- set the following serial numbers for the corresponding Encoder Data Set: p0441= FF, p0442 = 0, p0443 = 0, p0444 = 0, p0445 = 0.

- parameterize F07414 as message type N (p2100, p2101).

See also: p0491 (Motor encoder fault response ENCODER)

Remedy:

Re causes 1, 2:

Carry out an automatic adjustment using the pole position identification routine. Acknowledge the fault. Initiate the pole position identification routine with p1990 = 1. Then check that the pole position identification routine is correctly executed.

SERVO:

If a pole position identification technique is selected in p1980, and if p0301 does not contain a motor type with an encoder adjusted in the factory, then p1990 is automatically activated.

or

Set the adjustment via p0431. In this case, the new serial number is automatically accepted.

or

Mechanically adjust the encoder. Accept the new serial number with p0440 = 1.

Re causes 3, 4:

Accept the new serial number with p0440 = 1.

Drive object:	VECTOR_G130/G150
Reaction:	OFF1 (IASC/DCBRAKE, NONE, OFF2, OFF3, STOP1, STOP2)
Acknowledge:	PULSE INHIBIT
Cause:	The measured zero mark distance does not correspond to the parameterized zero mark distance. For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system. Cause:	The amplitude of the reference track signal (track R) does not lie within the tolerance bandwidth for encoder 2. The fault can be initiated when the unipolar voltage level is exceeded (RP/RN) or if the differential amplitude is under-shot. Fault value (r0949, interpret hexadecimal): xxxx hex: xxxx = Signal level, track R (16 bits with sign). The response thresholds of the unipolar signal levels of the encoder are between < 1400 mV and > 3500 mV. The response threshold for the differential signal level of the encoder is < -1600 mV. A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec. Note: The analog value of the amplitude error is not measured at the same time with the hardware fault output by the Sensor Module. The fault value can only be represented between -32767dec and 32767dec (-770 mV ... 770 mV). The signal level is not evaluated unless the following conditions are satisfied: - Sensor Module properties available (r0459.31 = 1). - Monitoring active (p0437.31 = 1).
Remedy:	- check the speed range; frequency characteristic (amplitude characteristic) of the measuring equipment might not be sufficient for the speed range - check that the encoder cables and shielding are routed in compliance with EMC. - check the plug connections and contacts of the encoder cable. - check whether the zero mark is connected and the signal cables RP and RN have been connected correctly - replace the encoder cable. - if the coding disk is soiled or the lighting aged, replace the encoder.

Cause: The measured zero mark distance does not correspond to the parameterized zero mark distance.
 For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system.
 The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder).

yyyy = Angle

xxxx = Amplitude, i.e. root from $A^2 + B^2$ (16 bits without sign)

The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %).

The response threshold is < 300 mV (observe the frequency response of the encoder).

A signal level of 500 mV peak value corresponds to the numerical value 299A hex = 10650 dec.

The angle 0 ... FFFF hex corresponds to 0 ... 360 degrees of the fine position. Zero degrees is at the negative zero crossover of track B.

Note for sensors modules for resolvers (e. g. SMC10):

The nominal signal level is at 2900 mV (2.0 Vrms). The response threshold is < 1414 mV (1.0 Vrms).

A signal level of 2900 mV peak value corresponds to the numerical value 3333 hex = 13107 dec.

Note:

The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.

Remedy:	- check the speed range, frequency characteristic (amplitude characteristic) of the measuring equipment is not sufficient for the speed range. - check that the encoder cables and shielding are routed in compliance with EMC. - check the plug connections - replace the encoder or encoder cable - check the Sensor Module (e.g. contacts). - if the coding disk is soiled or the lighting aged, replace the encoder.

Cause:	For a configured linear axis without modulo correction, the drive/encoder has exceeded the maximum possible traversing range. The value should be read in p0412 and interpreted as the number of motor revolutions. For p0411.0 = 1, the maximum traversing range for the configured linear axis is defined to be 64x (+/- 32x) of p0421. For p0411.3 = 1, the maximum traversing range for the configured linear axis is preset (default value) to the highest possible value and is +/-p0412/2 (rounded off to complete revolutions). Message value:	%1
Drive object:	VECTOR_G130/G150
Reaction:	OFF1 (IASC/DCBRAKE, NONE, OFF2, OFF3, STOP1, STOP2)
Acknowledge:	PULSE INHIBIT
Cause:	The measured zero mark distance does not correspond to the parameterized zero mark distance. For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). Fault value (r0949, interpret decimal): Last measured zero mark distance in increments (4 increments = 1 encoder pulse). Message value: R track: %1

Drive object: VECTOR_G130/G150

Reaction: OFF1 (IASC/DCBRAKE, NONE, OFF2, OFF3)

Acknowledge: IMMEDIATELY

Cause: The amplitude of the reference track signal (track R) does not lie within the tolerance bandwidth for encoder 3.
The fault can be initiated when the unipolar voltage level is exceeded (RP/RN) or if the differential amplitude is under-shot.
Fault value (r0949, interpret hexadecimal):
xxxx hex:
xxxx = Signal level, track R (16 bits with sign).
The response thresholds of the unipolar signal levels of the encoder are between < 1400 mV and > 3500 mV.
The response threshold for the differential signal level of the encoder is < -1600 mV.
A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec.
Note:
The analog value of the amplitude error is not measured at the same time with the hardware fault output by the Sensor Module.
The fault value can only be represented between -32767dec and 32767dec (-770 mV ... 770 mV).
The signal level is not evaluated unless the following conditions are satisfied:
- Sensor Module properties available (r0459.31 = 1).
- Monitoring active (p0437.31 = 1).

Remedy:

- check the speed range; frequency characteristic (amplitude characteristic) of the measuring equipment might not be sufficient for the speed range
- check that the encoder cables and shielding are routed in compliance with EMC.
- check the plug connections and contacts of the encoder cable.

- check whether the zero mark is connected and the signal cables RP and RN have been connected correctly
- replace the encoder cable.

Cause:	The amplitude (root of $A^2 + B^2$) for encoder 3 exceeds the permissible tolerance. Fault value (r0949, interpret hexadecimal): yyyyxxxx hex: yyyy = Signal level, track B (16 bits with sign). xxxx = Signal level, track A (16 bits with sign). The nominal signal level of the encoder must lie in the range 375 mV to 600 mV (500 mV -25/+20 %). The response thresholds are < 230 mV (observe the frequency response of the encoder) and > 750 mV. A signal level of 500 mV peak value corresponds to the numerical value 5333 hex = 21299 dec. Note for sensors modules for resolvers (e. g. SMC10): The nominal signal level is at 2900 mV (2.0 Vrms). The response thresholds are < 1070 mV and > 3582 mV. A signal level of 2900 mV peak value corresponds to the numerical value 6666 hex = 26214 dec. Note: The analog values of the amplitude error are not measured at the same time with the hardware fault output by the Sensor Module.
Remedy:	- check that the encoder cables and shielding are routed in compliance with EMC. - check the plug connections - replace the encoder or encoder cable - check the Sensor Module (e.g. contacts). The following applies to measuring systems without their own bearing system: - adjust the scanning head and check the bearing system of the measuring wheel. The following applies for measuring systems with their own bearing system: - ensure that the encoder housing is not subject to any axial force.

Cause:	Absolute encoder: When cyclically reading the absolute position, an excessively high difference to the incremental position was detected. The absolute position that was read is rejected. Limit value for the deviation: - EnDat encoder: Is supplied from the encoder and is a minimum of 2 quadrants (e.g. EQI 1325 > 2 quadrants, EQN 1325 > 50 quadrants). - other encoders: 15 pulses = 60 quadrants. Incremental encoder: When the zero pulse is passed, a deviation in the incremental position was detected. For equidistant zero marks, the following applies: - The first zero mark passed supplies the reference point for all subsequent checks. The other zero marks must have n times the distance referred to the first zero mark. For distance-coded zero marks, the following applies: - the first zero mark pair supplies the reference point for all subsequent checks. The other zero mark pairs must have the expected distance to the first zero mark pair. Fault value (r0949, interpret decimal): Deviation in quadrants (1 pulse = 4 quadrants).

Cause:	The measured zero mark distance does not correspond to the parameterized zero mark distance. For distance-coded encoders, the zero mark distance is determined from zero marks detected pairs. This means that if a zero mark is missing, depending on the pair generation, this cannot result in a fault and also has no effect in the system. The zero mark distance for the zero mark monitoring is set in p0425 (rotary encoder) or p0424 (linear encoder). Message value: -
Drive object: VECTOR_G130/G150
Reaction: OFF1 (NONE, OFF2, OFF3)
Acknowledge: IMMEDIATELY
Cause: For a configured linear axis without modulo correction, the drive/encoder has exceeded the maximum possible traversing range. The value should be read in p0412 and interpreted as the number of motor revolutions.
For p0411.0 = 1, the maximum traversing range for the configured linear axis is defined to be 64x (+/- 32x) of p0421.
For p0411.3 = 1, the maximum traversing range for the configured linear axis is preset (default value) to the highest possible value and is +/-p0412/2 (rounded off to complete revolutions). The highest possible value depends on the pulse number (p0408) and the fine resolution (p0419).

F33811 (N, A) Encoder 3: Encoder serial number changed

Message value: -
Drive object: VECTOR_G130/G150
Reaction: OFF1 (NONE, OFF2, OFF3)
Acknowledge: IMMEDIATELY
Cause: The encoder serial number has changed. The change is only checked for encoders with serial number (e.g. EnDat encoders).
Cause:
The encoder was replaced.
Note:
With closed-loop position control, the serial number is accepted when starting the adjustment (p2507 = 2).
When the encoder is adjusted (p2507 = 3), the serial number is checked for changes and if required, the adjustment is reset (p2507 = 1).
Proceed as follows to hide serial number monitoring:
- set the following serial numbers for the corresponding Encoder Data Set: p0441= FF, p0442 = 0, p0442 = 0, p0444 = 0, p0445 = 0.

Remedy: Mechanically adjust the encoder. Accept the new serial number with p0440 = 1.

The following expected states are tested in the test steps when testing the FDOs:

The information below is displayed in the following format:

Test step (SL MA): Expected DiagDO mode 1 | Expected DI20..23 mode 2 | Expected DI20..23 mode 3

(0x4C 0x57): DiagDO=0V | DI=24V | DI=24V

(0x62 0x6D): DiagDO=0V | DI=0V | DI=0V

(0x78 0x83): DiagDO=0V | DI=0V | DI=24V

(0x8E 0x99): DiagDO=24V | DI=0V | DI=24V

(0xA4 0xAF): DiagDO=0V | DI=24V | DI=24V

Example:

If an error with fault causes (bb) 0x02 or 0x04 occurs in a test stop step, the test action for the fault took place in the previous test stop step. The expected states are tested in the next step.

Master signals fault value 0001_04AF and slave signals fault value 0001_04A4.

aaaa = 1 i.e. FDO 0 affected

bb = 04h i.e. testing of DiagFDO has failed

cc = The expected states were tested in test stop step AF on the master and A4 on the slave. Expected state DiagDO=0V is being tested in the table; in other words, the Diag DO was at 0 V instead of the expected 24 V. The associated test action took place in the previous step (0x99 DO OFF 0xA4 DO OFF). Both DOs were switched to OFF.

Remedy: Check the wiring of the F-DIs and F-DOs and restart the test stop. The fault is withdrawn if the test stop is successfully completed.

Fault values 0xCCCCCCCC / 0xDDDDDDDD / 0xEEEEEEEE : These fault values are triggered together with alarm 35152. If they appear, you should check all test stop parameters. You should also check whether the firmware version of the TM54F matches the Control Unit's software version.

You also need to check P10001, P10017, P10046, and P10047.

Bit 5 = 1: No communication with drive 6.
For fault value = 0, the following applies:
The number of drive objects specified in p10010 is not equal to the number of drives that have drive-based motion monitoring functions that have been enabled.
The drive object number for drive n is set in p10010[n-1].
When this fault is present, none of the drives that have drive-based motion monitoring functions operating with TM54F, are enabled.
Remedy: For all drive objects specified in p10010, check whether the drive-based motion monitoring functions with TM54F are enabled (p9601).

A35016 TM54F: Net data communication with drive not established

Message value: -
Drive object: TM54F_MA, TM54F_SL, VECTOR_G130/G150
Reaction: NONE
Acknowledge: NONE
Cause: The cyclic net data communication within the Terminal Module 54F (TM54F) is still not active.
This message is output after the TM54F master and TM54F slave have booted and is automatically withdrawn as soon as communications have been established.
If a drive does not communicate with the TM54F, then none of the drives parameterized in p10010 are enabled.
Remedy: When replacing a Motor Module, carry out the following steps:
- start the copy function for the node identifier on the TM54F (p9700 = 1D hex).
- acknowledge the hardware CRC on the TM54F (p9701 = EC hex).
- save all parameters (p0977 = 1).
- carry out a POWER ON (power off/on) for all components.
The following always applies:
- for all drive objects specified in p10010, check whether the drive-based motion monitoring functions with TM54F are enabled (p9601).
- check whether fault F35150 is present and if required, remove the cause of the fault.

F35151	TM54F: Discrepancy error
Message value:	%1
Drive object:	TM54F_MA, TM54F_SL, VECTOR_G130/G150
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	The safety input terminals or output terminals show a different state longer than that parameterized in p10002. Fault value (r0949, interpret hexadecimal): yyyyxxxx hex xxxx: The safety-relevant input terminals F-DI indicate a discrepancy. Bit 0: Discrepancy for F-DI 0 ... Bit 9: Discrepancy for F-DI 9 yyyy: The safety-relevant output terminals F-DO indicate a discrepancy. Bit 0: Discrepancy for F-DO 0 ... Bit 3: Discrepancy for F-DO 3 Note: If several discrepancy errors occur consecutively, then this fault is only signaled for the first error that occurs. The following possibilities exist of diagnosing all of the discrepancy errors: - in the commissioning software, evaluate the input states and output states of the TM54F. All discrepancy errors are displayed here. - compare parameters p10051 and p10052 from the TM54F master and TM54F slave for discrepancy.
Remedy:	Check the wiring of the F-DI and F-DO (contact problems). Note: A discrepancy of the F-DO also occurs (in this special case, in conjunction with fault F35150 for the TM54F slave), if, after replacing a Motor Module, it was forgotten to acknowledge this. When replacing a Motor Module, carry out the following steps: - start the copy function for the node identifier on the TM54F (p9700 = 1D hex). - acknowledge the hardware CRC on the TM54F (p9701 = EC hex). - save all parameters (p0977 = 1). - carry out a POWER ON (power off/on) for all components. Discrepancy errors in the F-DIs can only be completely acknowledged if, after the cause of the error was resolved, safe acknowledgement was carried out (see p10006). As long as safety acknowledgement was not carried out, the corresponding F-DI stays in the safe state. F-DI: Failsafe Digital Input F-DO: Failsafe Digital Output

Where switching operations recur cyclically on the FDIs, the discrepancy time must be parameterized as follows:
 td = possible actual discrepancy time (in ms) that can occur with a switching operation. This must correspond to at least 1 SI sampling cycle (see p10000).
 tp = period for a switching operation in ms.
 The following rules must be adhered to:
 $p10002 < (tp/2) - td$ (discrepancy time must be less than half the period minus the actual discrepancy time)
 $p10002 \geq p10000$ (discrepancy time must be no less than P10000)
 $p10002 > td$ (discrepancy time must be greater than the switch discrepancy time which may actually apply)
 Example: If SI sampling cycle is 12 ms and switching frequency is 110 ms, the maximum discrepancy time which can be set is as follows:
 $p10002 \leq 110\text{ms}/2 - 12\text{ms} = 43\text{ms}$; this rounds off to $P10002 \leq 36\text{ms}$.
 (Since the sampling time can only be accepted as a whole SI sampling cycle, the value will need to be rounded up or down to a whole SI sampling time value if it is not an exact multiple of an SI sampling cycle.)

Message value:	Component number: %1
Drive object:	HUB, TM31, VECTOR_G130/G150
Reaction:	NONE
Acknowledge:	IMMEDIATELY
Cause:	The properties of the DRIVE-CLiQ component (DRIVE-CLiQ Hub Module), specified by the fault value, have changed in an incompatible fashion with respect to the properties when booted. One cause can be, e.g. that a DRIVE-CLiQ cable or DRIVE-CLiQ component has been replaced. Fault value (r0949, interpret decimal): Component number.
Remedy:	- carry out a POWER ON. - when a component is replaced, the same component type and if possible the same firmware version should be used. - when a cable is replaced, only cables whose length is the same as or as close as possible to the length of the original cables should be used (ensure compliance with the maximum cable length).

F49155 Cooling system: Power Stack Adapter, firmware version too old

Message value: -

Drive object: VECTOR_G130/G150

Reaction: OFF2

Acknowledge: POWER ON

Cause: The firmware version in the Power Stack Adapter (PSA) is too old and does not support the liquid cooling.

Remedy: Upgrade the firmware. Check EEPROM data.

F49156 Cooling system: Cooling liquid temperature has exceeded the fault threshold

Message value: -

Drive object: VECTOR_G130/G150

Reaction: OFF2

Acknowledge: IMMEDIATELY

Cause: The cooling liquid intake temperature has exceeded the permanently set fault threshold.

Remedy: Check the cooling system and the ambient conditions.

A49170 Cooling system: Alarm has occurred

Message value: -

Drive object: VECTOR_G130/G150

Reaction: NONE

Acknowledge: NONE

Cause: The cooling system signals a general alarm.

Remedy:

- check the wiring between the cooling system and the input terminal (Terminal Module).
- check the external control device for the cooling system.

A49171 Cooling system: Conductivity has exceeded the alarm threshold

Message value: -

Drive object: VECTOR_G130/G150

Reaction: NONE

Acknowledge: NONE

Cause: Conductivity monitoring is set for the cooling liquid (r0267.7, from p0266[7]).
See also: p0261 (Cooling system, starting time 2), p0262 (Cooling system, fault conductivity delay time), p0266 (Cooling system, feedback signals, signal source), r0267 (Cooling system status word)

Remedy: Check the device to de-ionize the cooling liquid.

A49172 Cooling system: Conductivity actual value is not valid

Message value: -

Drive object: VECTOR_G130/G150

Reaction: NONE

Acknowledge: NONE

Cause: When monitoring the conductivity of the cooling liquid, there is a fault in the wiring or in the sensor.

Remedy:

- check the wiring between the cooling system and the Power Stack Adapter (PSA).
- check the function of the sensor to measure the conductivity.

A49173	Cooling system: Cooling liquid temperature has exceeded the alarm threshold
Message value:	-
Drive object:	VECTOR_G130/G150
Reaction:	NONE
Acknowledge:	NONE
Cause:	The cooling liquid intake temperature has exceeded the specified alarm threshold.
Remedy:	Check the cooling system and the ambient conditions.

F49200	Excitation group signal fault
Message value:	%1
Drive object:	VECTOR_G130/G150
Reaction:	OFF2
Acknowledge:	IMMEDIATELY
Cause:	The excitation sequence control signals a fault. Fault value (r0949, interpret hexadecimal): Bit 0: When powered down or when powering down the excitation, the signal "excitation ready to power up feedback signal" was not received within the monitoring time. Bit 1: After an ON command, the signal "excitation ready feedback signal" was not received within the monitoring time. Bit 2: After the pulses were enabled, the signal "excitation operational feedback signal" was not received within the monitoring time. Bit 3: The "excitation group signal fault" signal is present.
Remedy:	- check the excitation. - check commands, feedback signals and BICO interconnections.

A49201 (F)	Excitation group signal alarm
Message value:	-
Drive object:	VECTOR_G130/G150
Reaction:	NONE
Acknowledge:	NONE
Cause:	The "excitation group signal alarm" signal is present.
Remedy:	Check the excitation equipment.
Reaction upon F:	NONE

Message value: Info. 1: %1, info. 2: %2

Drive object: All objects

Reaction: NONE

Acknowledge: NONE

Cause: In the case of CBE20 SINAMICS Link:
The parameter assignment indicates that the sender and the receiver are one and the same. This is not permitted.
Alarm value (r2124, interpret hexadecimal):
yyyyxxxx hex: yyyy = info. 1, xxxx = info. 2
Info. 1 (interpret decimal) = Drive object number from p8872
Info. 2 (interpret decimal) = Index from p8872
See also: p8836 (SINAMICS Link address), p8872 (SINAMICS Link address receive PZD)

Remedy: In the case of CBE20 SINAMICS Link:
Correct the parameter assignment. All p8872[index] must be set to a value not equal to p8836.

List of abbreviations

B

Note:

The following list of abbreviations includes all abbreviations and their meanings used in the entire SINAMICS user documentation.

Abbreviation	Source of abbreviation	Meaning
A		
A...	Alarm	Alarm
AC	Alternating Current	Alternating current
ADC	Analog Digital Converter	Analog digital converter
AI	Analog Input	Analog input
AIM	Active Interface Module	Active Interface Module
ALM	Active Line Module	Active Line Module
AO	Analog Output	Analog output
AOP	Advanced Operator Panel	Advanced operator panel
APC	Advanced Positioning Control	Advanced Positioning Control
AR	Automatic Restart	Automatic restart
ASC	Armature Short-Circuit	Armature short-circuit
ASCII	American Standard Code for Information Interchange	American Standard Code for Information Interchange
IM	Induction motor	Induction motor
B		
BB	Betriebsbedingung	Operating condition
BERO	-	Contact-free proximity switch
BI	Binector Input	Binector input
BIA	Berufsgenossenschaftliches Institut für Arbeitssicherheit	Germany's Institute for Occupational Safety and Health
BICO	Binector Connector Technology	Binector connector technology
BLM	Basic Line Module	Basic Line Module
BO	Binector Output	Binector output
BOP	Basic Operator Panel	Basic Operator Panel
C		
C	Capacitance	Capacitance
C...	-	Safety message
CAN	Controller Area Network	Serial bus system

Abbreviation	Source of abbreviation	Meaning
CBC	Communication Board CAN	Communication Board CAN
CD	Compact Disc	Compact disc
CDS	Command Data Set	Command data set
CF Card	CompactFlash Card	CompactFlash memory card
CI	Connector Input	Connector input
CLC	Clearance Control	Clearance control
CNC	Computerized Numerical Control	Computerized numerical control
CO	Connector Output	Connector output
CO/BO	Connector Output/Binector Output	Connector output/binector output
COB ID	CAN Object Identification	CAN object identification
COM	Common contact of a change-over relay	Center contact on a changeover contact
COMM	Commissioning	Commissioning
CP	Communications Processor	Communications processor
CPU	Central Processing Unit	Central processing unit
CRC	Cyclic Redundancy Check	Cyclic redundancy check
CSM	Control Supply Module	Control Supply Module
CU	Control Unit	Control Unit
CUA	Control Unit Adapter	Control Unit Adapter
CUD	Control Unit DC MASTER	Control Unit DC MASTER
D		
DAC	Digital Analog Converter	Digital analog converter
DC	Direct Current	Direct current
DCB	Drive Control Block	Drive Control Block
DCC	Drive Control Chart	Drive Control Chart
DCC	Data Cross Check	Crosswise data comparison
DCN	Direct Current Negative	Direct current negative
DCP	Direct Current Positive	Direct current positive
DDS	Drive Data Set	Drive data set
DI	Digital Input	Digital input
DI/DO	Digital Input/Digital Output	Digital input/digital output, bidirectional
DMC	DRIVE-CLiQ Hub Module Cabinet	DRIVE-CLiQ Hub Module Cabinet
DME	DRIVE-CLiQ Hub Module External	DRIVE-CLiQ Hub Module External
DO	Digital Output	Digital output
DO	Drive Object	Drive object
DP	Decentralized Peripherals	Distributed I/O
DPRAM	Dual-Port Random Access Memory	Memory with dual access
DRAM	Dynamic Random Access Memory	Dynamic memory
DRIVE-CLiQ	Drive Component Link with IQ	Drive Component Link with IQ
DSC	Dynamic Servo Control	Dynamic Servo Control
E		
EASC	External Armature Short-Circuit	External armature short-circuit

Abbreviation	Source of abbreviation	Meaning
EDS	Encoder Data Set	Encoder data set
EGB	Elektrostatisch gefährdete Baugruppen	Electrostatic sensitive devices
ELCB	Earth Leakage Circuit Breaker	Residual current operated circuit breaker
ELP	Earth Leakage Protection	Ground-fault monitoring
EMC	Electromagnetic Compatibility	Electromagnetic compatibility
EMF	Electromagnetic Force	Electromagnetic force
EMK	Elektromagnetische Kraft	Electromagnetic force
EMV	Elektromagnetische Verträglichkeit	Electromagnetic compatibility
EN	Europäische Norm	European standard
EnDat	Encoder Data Interface	Encoder interface
EP	Enable Pulses	Pulse enable
EPOS	Einfachpositionierer	Basic positioner
ES	Engineering System	Engineering System
ESB	Ersatzschaltbild	Equivalent circuit diagram
ESD	Electrostatic Sensitive Devices	Electrostatic sensitive devices
ESR	Extended Stop and Retract	Extended stop and retraction
F		
F...	Fault	Fault
FAQ	Frequently Asked Questions	Frequently asked questions
FBL	Free Blocks	Free function blocks
FCC	Function Control Chart	Function Control Chart
FCC	Flux Current Control	Flux current control
FD	Function Diagram	Function diagram
F-DI	Failsafe Digital Input	Failsafe digital input
F-DO	Failsafe Digital Output	Failsafe digital output
FEM	Fremderregter Synchronmotor	Separately excited synchronous motor
FEPROM	Flash EPROM	Non-volatile read/write memory
FG	Function Generator	Function generator
FI	-	Fault current
FOC	Fiber-Optic Cable	Fiber-optic cable
FP	Funktionsplan	Function diagram
FPGA	Field Programmable Gate Array	Field programmable gate array
FW	Firmware	Firmware
G		
GB	Gigabyte	Gigabyte
GC	Global Control	Global Control Telegram (broadcast telegram)
GND	Ground	Reference potential for all signal and operating voltages, usually defined as 0 V (also referred to as G)
GSD	Gerätestammdatei	Device master data: Describes the characteristics of a PROFIBUS slave

Abbreviation	Source of abbreviation	Meaning
GSV	Gate Supply Voltage	Gate Supply Voltage
GUID	Globally Unique Identifier	Globally unique identifier
H		
HF	High Frequency	High frequency
HFD	Hochfrequenzdrossel	High-frequency reactor
HLG	Hochlaufgeber	Ramp-function generator
HMI	Human Machine Interface	Human Machine Interface
HTL	High-Threshold Logic	Logic with a high fault threshold
HW	Hardware	Hardware
I		
i. V.	In Vorbereitung	Under development: This feature is not currently available.
I/O	Input/Output	Input/Output
I2C	Inter-Integrated Circuit	Internal serial data bus
IASC	Internal Armature Short-Circuit	Internal armature short-circuit
IBN	Inbetriebnahme	Commissioning
ID	Identifier	Identification
IE	Industrial Ethernet	Industrial Ethernet
IEC	International Electrotechnical Commission	International Electrotechnical Commission
IF	Interface	Interface
IGBT	Insulated Gate Bipolar Transistor	Insulated gate bipolar transistor
IGCT	Integrated Gate-Controlled Thyristor	Semiconductor circuit breaker with integrated control electrode
IL	Impulslöschung	Pulse cancelation
IP	Internet Protocol	Internet Protocol
IPO	Interpolator	Interpolator
IT	Isolé Terré	Insulated three-phase supply network
IVP	Internal Voltage Protection	Internal voltage protection
J		
JOG	Jogging	Jog
K		
CDC	Crosswise Data Comparison	Crosswise data comparison
KIP	Kinetische Pufferung	Kinetic buffering
Kp	-	Proportional gain
KTY	-	Special temperature sensor
L		
L	-	Formula symbol for inductance
LED	Light-Emitting Diode	Light-emitting diode
LIN	Linear motor	Linear motor
LR	Lageregler	Position controller
LSB	Least Significant Bit	Least Significant Bit
LSC	Line-Side Converter	Line-side converter

Abbreviation	Source of abbreviation	Meaning
LSS	Line Side Switch	Line side switch
LU	Length Unit	Length unit
LWL	Lichtwellenleiter	Fiber-optic cable
M		
M	-	Formula symbol for torque
M	Masse	Reference potential for all signal and operating voltages, usually defined as 0 V (also referred to as GND)
MB	Megabyte	Megabyte
MCC	Motion Control Chart	Motion Control Chart
MDS	Motor Data Set	Motor data set
MLFB	Maschinenlesbare Fabrikatebezeichnung	Machine-Readable Product Code
MMC	Man-Machine Communication	Man-machine communication
MMC	Micro Memory Card	Micro memory card
MSB	Most Significant Bit	Most significant bit
MSC	Motor-Side Converter	Motor-side converter
MSCY_C1	Master Slave Cycle Class 1	Cyclic communication between master (Class 1) and slave
MSR	Motorstromrichter	Motor-side converter
MT	Messtaster	Probe
N		
N. C.	Not Connected	Not connected
N...	No Report	No message or internal message
NAMUR	Normenarbeitsgemeinschaft für Mess- und Regeltechnik in der chemischen Industrie	Standardization association for measurement and control in chemical industries
NC	Normally Closed (contact)	NC contact
NC	Numerical Control	Numerical control
NEMA	National Electrical Manufacturers Association	Standardization body in the USA (United States of America)
NM	Nullmarke	Zero mark
NO	Normally Open (contact)	NO contact
NSR	Netzstromrichter	Line-side converter
NVRAM	Non-Volatile Random Access Memory	Non-volatile read/write memory
O		
OA	Open Architecture	Open Architecture
OC	Operating Condition	Operating condition
OEM	Original Equipment Manufacturer	Original equipment manufacturer
OLP	Optical Link Plug	Fiber-optic bus connector
OMI	Option Module Interface	Option module interface
P		
p...	-	Adjustable parameters
PB	PROFIBUS	PROFIBUS

Abbreviation	Source of abbreviation	Meaning
PcCtrl	PC Control	Control for master
PD	PROFIdrive	PROFIdrive
PDS	Power Unit Data Set	Power unit data set
PE	Protective Earth	Protective earth
PELV	Protective Extra Low Voltage	Protective extra low voltage
PEM	Permanent-magnet synchronous motor	Permanent-magnet synchronous motor
PG	Programmiergerät	Programming device
PI	Proportional Integral	Proportional integral
PID	Proportional Integral Differential	Proportional integral differential
PLC	Programmable Logic Controller	Programmable logic controller
PLL	Phase-Locked Loop	Phase-locked loop
PN	PROFINET	PROFINET
PNO	PROFIBUS Nutzerorganisation	PROFIBUS user organization
PPI	Point-to-Point Interface	Point-to-point interface
PRBS	Pseudo Random Binary Signal	White noise
PROFIBUS	Process Field Bus	Serial data bus
PS	Power Supply	Power supply
PSA	Power Stack Adapter	Power Stack Adapter
PTC	Positive Temperature Coefficient	Positive temperature coefficient
PTP	Point-To-Point	Point-to-Point
PWM	Pulse Width Modulation	Pulse width modulation
PZD	Prozessdaten	Process data
R		
r...	-	Display parameters (read-only)
RAM	Random Access Memory	Read/write memory
RCCB	Residual Current Circuit Breaker	Residual current operated circuit breaker
RCD	Residual Current Device	Residual current operated circuit breaker
RCM	Residual Current Monitor	Residual current monitor
RFG	Ramp-Function Generator	Ramp-function generator
RJ45	Registered Jack 45	Term for an 8-pin socket system for data transmission with shielded or non-shielded multi-wire copper cables
RKA	Rückkühlanlage	Cooling unit
RO	Read Only	Read only
RPDO	Receive Process Data Object	Receive process data object

Abbreviation	Source of abbreviation	Meaning
RS232	Recommended Standard 232	Interface standard for cable-connected serial data transmission between a sender and receiver (also known as EIA232)
RS485	Recommended Standard 485	Interface standard for a cable-connected differential, parallel, and/or serial bus system (data transmission between a number of senders and receivers, also known as EIA485)
RTC	Real Time Clock	Real time clock
RZA	Raumzeigerapproximation	Space vector approximation
S		
S1	-	Uninterrupted duty
S3	-	Intermittent duty
SBC	Safe Brake Control	Safe brake control
SBH	Sicherer Betriebshalt	Safe operating stop
SBR	-	Safe acceleration monitoring
SCA	Safe Cam	Safe cam
SD Card	Secure Digital Card	Secure digital memory card
SE	Sicherer Software-Endschalter	Safe software limit switch
SG	Sicher reduzierte Geschwindigkeit	Safely-Limited Speed
SGA	Sicherheitsgerichteter Ausgang	Safety-related output
SGE	Sicherheitsgerichteter Eingang	Safety-related input
SH	Sicherer Halt	Safe standstill
SI	Safety Integrated	Safety Integrated
SIL	Safety Integrity Level	Safety Integrity Level
SLM	Smart Line Module	Smart Line Module
SLP	Safely-Limited Position	Safely-Limited Position
SLS	Safely-Limited Speed	Safely limited speed
SLVC	Sensorless Vector Control	Vector control without encoder
SM	Sensor Module	Sensor Module
SMC	Sensor Module Cabinet	Sensor Module Cabinet
SME	Sensor Module External	Sensor Module External
SN	Sicherer Software-Nocken	Safe software cam
SOS	Safe Operating Stop	Safe operating stop
SP	Service Pack	Service pack
SPC	Setpoint Channel	Setpoint channel
SPI	Serial Peripheral Interface	Serial interface for connecting peripherals
SPS	Speicherprogrammierbare Steuerung	Programmable logic controller
SS1	Safe Stop 1	Safe stop 1 (monitored for time and ramping up)
SS2	Safe Stop 2	Safe stop 2
SSI	Synchronous Serial Interface	Synchronous serial interface

Abbreviation	Source of abbreviation	Meaning
SSM	Safe Speed Monitor	Safe feedback for speed monitoring ($n < n_x$)
SSP	SINAMICS Support Package	SINAMICS support package
STO	Safe Torque Off	Safe torque off
STW	Steuerwort	Control word
T		
TB	Terminal Board	Terminal Board
TIA	Totally Integrated Automation	Totally Integrated Automation
TM	Terminal Module	Terminal Module
TN	Terre Neutre	Grounded three-phase supply network
T _n	-	Integral time
TPDO	Transmit Process Data Object	Transmit process data object
TT	Terre Terre	Grounded three-phase supply network
TTL	Transistor-Transistor Logic	Transistor-transistor logic
T _v	-	Rate time
U		
UL	Underwriters Laboratories Inc.	Underwriters Laboratories Inc.
UPS	Uninterruptible Power Supply	Uninterruptible power supply
USV	Unterbrechungsfreie Stromversorgung	Uninterruptible power supply
UTC	Universal Time Coordinated	Universal Time Coordinated
V		
VC	Vector Control	Vector control
V _{dc}	-	DC link voltage
V _{dcN}	-	Partial DC link voltage negative
V _{dcP}	-	Partial DC link voltage positive
VDE	Verband Deutscher Elektrotechniker	Association of German Electrical Engineers
VDI	Verein Deutscher Ingenieure	Association of German Engineers
VPM	Voltage Protection Module	Voltage Protection Module
V _{pp}	Volt peak to peak	Volt peak to peak
VSM	Voltage Sensing Module	Voltage Sensing Module
W		
WEA	Wiedereinschaltautomatik	Automatic restart
MT	Machine Tool	Machine tool
X		
XML	Extensible Markup Language	Standard language for Web publishing and document management
Z		
ZK	Zwischenkreis	DC link
ZM	Zero Mark	Zero mark
ZSW	Zustandswort	Status word
